# TRANSITION FORMULAE FOR RANKS OF ABELIAN VARIETIES 

DANIEL DELBOURGO AND ANTONIO LEI

#### Abstract

Let $A_{/ k}$ denote an abelian variety defined over a number field $k$ with good ordinary reduction at all primes above $p$, and let $K_{\infty}=\bigcup_{n>1} K_{n}$ be a $p$-adic Lie extension of $k$ containing the cyclotomic $\mathbb{Z}_{p}$-extension. We use K-theory to find recurrence relations for the $\lambda$-invariant at each $\sigma$-component of the Selmer group over $K_{\infty}$, where $\sigma: G_{k} \rightarrow \mathrm{GL}(V)$. This provides upper bounds on the Mordell-Weil rank for $A\left(K_{n}\right)$ as $n \rightarrow \infty$ whenever $G_{\infty}=$ $\operatorname{Gal}\left(K_{\infty} / k\right)$ has dimension at most 3.

## 1. Introduction

Let $E$ be an elliptic curve defined over a number field $k$, and suppose that $E$ has good ordinary reduction at all places lying above a prime $p \neq 2$. Assuming $E$ has no complex multiplication (and under extra hypotheses), Coates and Howson [3, Proposition 6.9] showed

$$
\operatorname{rank}_{\mathbb{Z}}\left(E\left(K_{n}\right)\right) \leq c \times p^{3 n} \quad \text { for some constant } c=c(E, p)>0
$$

[^0]where $K_{n}=K\left(E\left[p^{n}\right]\right)$ are the fields generated by $p^{n}$-division points on $E$. In this article, we address the following

Question. If one replaces the $\mathrm{GL}\left(2, \mathbb{Z}_{p}\right)$-extension above by an arbitrary Lie extension $K_{\infty}=\bigcup_{n \geq 1} K_{n}$, and the elliptic curve by a g-dimensional abelian variety $A$ defined over $k$, then can one obtain similar bounds?
Conjecture. If $k\left(\mu_{p^{\infty}}\right) \subset K_{\infty}$, the rank of $A\left(K_{n}\right)$ is $O\left(p^{n \times(d-1)}\right)$, where $d=$ $\operatorname{dim}\left(\operatorname{Gal}\left(K_{\infty} / k\right)\right)$.

We shall prove a stronger form of this conjecture in the special case where our $p$-adic Lie extension $K_{\infty}$ of $k$ is of dimension $\leq 3$, and satisfies:
(a) $K_{\infty}$ contains the cyclotomic $\mathbb{Z}_{p}$-extension $k_{\infty}$ of $k$;
(b) $H:=\operatorname{Gal}\left(K_{\infty} / k_{\infty}\right)$ is a pro- $p$ group with no $p$-torsion.

In particular, we remark that the group $G_{\infty}:=\operatorname{Gal}\left(K_{\infty} / k\right)$ must be without any $p$ torsion, so its Iwasawa algebra $\Lambda\left(G_{\infty}\right)=\lim _{U} \mathbb{Z}_{p}\left[G_{\infty} / U\right]$ contains no zero-divisors. Let $\mathcal{O}$ be the ring of integers of a finite extension of $\mathbb{Q}_{p}$, and set $\Gamma_{k}=G_{\infty} / H \cong$ $\mathbb{Z}_{p}$. Given a compact finitely-generated $\mathcal{O} \llbracket \Gamma_{k} \rrbracket$-torsion module $\mathcal{J}$, we shall write $\lambda_{\mathcal{O} \llbracket \Gamma_{k} \rrbracket}(\mathcal{J})$ for its cyclotomic $\lambda$-invariant, which equals the number of zeros of the characteristic ideal $\operatorname{char}_{\mathcal{O} \llbracket \Gamma_{k} \rrbracket}(\mathcal{J})$ for $\mathcal{J}$.
Theorem. Suppose that $M=\operatorname{Sel}_{K_{\infty}}(A)^{\vee}$ is a $\Lambda\left(G_{\infty}\right)$-torsion module which belongs to the category $\mathfrak{M}_{H}\left(G_{\infty}\right)$; then for every p-adic Artin representation $\sigma: G_{\infty} \longrightarrow$ $\mathrm{GL}_{\mathcal{O}}\left(V_{\sigma}\right)$, one has a transition formula

$$
\lambda_{\mathcal{O} \llbracket \Gamma_{k} \rrbracket}\left(\operatorname{tw}_{\hat{\sigma}}(M)\right)=\sum_{i} n_{i}(\sigma) \times \lambda_{\mathcal{O} \llbracket \Gamma_{k} \rrbracket}\left(\operatorname{tw}_{\hat{\rho}_{i}} M\right)
$$

where the sum runs over a finite set of irreducible representations of $G_{\infty}$, and the constants $n_{i}(\sigma)$ are defined via the decomposition

$$
\psi_{p} \circ \operatorname{Tr}(\sigma)=\sum_{i} n_{i}(\sigma) \cdot \operatorname{Tr}\left(\rho_{i}\right)
$$

under the action of the p-th Adams operator $\psi_{p}$.
We refer the reader to Section 2 for full notation. The proof of this theorem is based upon a series of $\mathrm{K}_{1}$-congruences derived by Ritter and Weiss [13] which relate Akashi series of big Selmer groups, specialised at those Artin characters factoring through $K_{\infty} / k$. In particular, these allow us to find recurrence relations for their $\lambda$ invariants. Because the growth rate of these $\lambda$-invariants at the trace of the regular representation for $K_{n} / k$ is $O\left(p^{d n}\right)$ where $d=\operatorname{dim}\left(G_{\infty}\right)$, we obtain the following as a consequence.

Corollary. Under the same hypotheses and assuming $d=\operatorname{dim}\left(G_{\infty}\right) \leq 3$, there exists a filtration $k \subset K_{1} \subset \cdots \subset K_{n} \subset \cdots \subset K_{\infty}$ with $\left[K_{n}: k\right]=p^{d n}$ and $a$ natural number $n_{0} \leq 2$, such that

$$
\operatorname{rank}_{\mathbb{Z}}\left(A\left(K_{n}\right)\right) \leq C_{A, G_{\infty}} \times p^{(d-1) n}+(2 g)^{2} \quad \text { for all } n \geq n_{0}
$$

where $C_{A, G_{\infty}}=p^{-(d-1) n_{0}} \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n_{0}}} \rrbracket}\left(\operatorname{Sel}_{K_{\infty}}(A)_{H \cap \operatorname{Gal}\left(K_{\infty} / K_{n_{0}}\right)}^{\vee}\right) \geq 0$.
Let $G_{\infty}=\Sigma_{0} \supset \Sigma_{1} \supset \cdots \supset \Sigma_{n} \supset \ldots$ be a filtration of normal subgroups such that $\left[G: \Sigma_{n}\right]=p^{d n}$, and set $K_{n}$ to be the fixed field of $\Sigma_{n}$. We apply our main
theorem to the regular representation on $G_{\infty} / \Sigma_{n}$, and deduce a sufficient condition for the asymptotic formula (in the corollary) to hold is

$$
\begin{equation*}
\Sigma_{n}=\Sigma_{n-1}^{p} \tag{1.1}
\end{equation*}
$$

for all $n \geq n_{0}+1$. We then construct such a filtration using the theory of GonzálezSánchez and Klopsch [7], which classifies all analytic pro-p groups of dimension smaller than or equal to 3 .

The two-dimensional cases are easily disposed of (one need only study subgroups of $\mathbb{Z}_{p}^{2}$ or $\mathbb{Z}_{p} \rtimes \mathbb{Z}_{p}^{\times}$). For the three-dimensional case, note $G_{\infty}$ is isomorphic to $\left\langle x, y_{1}, y_{2}\right\rangle / \mathcal{R}$ where $x, y_{1}, y_{2}$ are distinguished generators for $G_{\infty}$, and $\mathcal{R}$ is a set of relations involving commutators of these generators. We define $\Sigma_{n}$ to be the subgroup generated by $x^{p^{n}}, y_{1}^{p^{n}}$ and $y_{2}^{p^{n}}$, and establish that (1.1) holds for $n \geq 3$ through a detailed study of commutators.

Remarks: (i) It should be mentioned that the techniques in this paper do not yield any lower bounds on the growth of $\operatorname{rank}_{\mathbb{Z}}\left(A\left(K_{n}\right)\right)$ as $n$ increases. To obtain such lower bounds, one should input parity information over $K_{n}$ in the manner of Harris, Matsuno, Mazur-Rubin, Coates et al, and others.
(ii) Whenever the constant term $C_{A, G_{\infty}}$ is zero, one immediately deduces from the corollary that $A\left(K_{\infty}\right)$ has finite $\mathbb{Z}$-rank, bounded above by $(2 g)^{2}$.
(iii) Provided one has a concrete realisation of the Galois group in terms of an explicit tower of numbers fields, in many cases it is possible to sharpen the upper bounds considerably; for example, if $\operatorname{dim}\left(G_{\infty}\right)=2$, then the $(2 g)^{2}$-term above may be removed altogether (see Theorem 3.4).
(iv) As John Coates pointed out to us, there is a quicker way to obtain the asymptotic bound in the above corollary (if one does not care too much about the precise constants $C_{A, G_{\infty}}$ and $n_{0}$ ); one instead studies directly the growth of the $H \cap \Sigma_{n}$-coinvariants for the large Selmer group. We refer the reader to [2] for a more succinct argument when $\operatorname{dim}\left(G_{\infty}\right)=2$.
(v) In the first appendix we show that (1.1) holds for $n \geq 1$ in a large number of cases. We include in the second appendix alternative proofs of our main result for both the Heisenberg and false-Tate curve extensions; whilst these are undoubtedly lengthier, they nicely illustrate the scaling effect which the $p$-th Adams operator induces on the regular representations.

Acknowledgments. Both authors are extremely grateful to the Australian Research Council for their support, as part of an ARC-DP1092496 grant. They are also indebted to the hospitality of University of Warwick (where the work was completed), and especially to David Loeffler and John Cremona. They are also thankful to the anonymous referee for the corrections and comments on an earlier version of the paper.

## 2. Generalities on $\lambda$-Invariants

We begin by explaining how the Ritter-Weiss $\mathrm{K}_{1}$-congruences can be used to derive some explicit upper bounds on the Mordell-Weil rank; in essence, we need to gain control over the cyclotomic $\lambda$-invariant over $K_{n}$ as $n \rightarrow \infty$.
2.1. Preliminary results on $p$-adic Lie extensions. Let $G_{\infty}$ and $H$ be $p$-adic Lie groups as in the introduction. Let $M$ denote a compact, finitely-generated torsion $\Lambda\left(G_{\infty}\right)$-module; henceforth, we shall impose:
Hypothesis $(\mu=0)$. The module $M$ is in the $\mathfrak{M}_{H}\left(G_{\infty}\right)$-category, i.e. the quotient $M / M\left[p^{\infty}\right]$ is of finite-type over $\Lambda(H)$.

This is equivalent to assuming the total vanishing of the $\mu$-invariants for $M$, over each of the finite normal extensions of $k$ inside $K_{\infty}$.

Let $\mathcal{O}$ be the ring of integers of a finite extension of $\mathbb{Q}_{p}$, and fix a uniformiser $\pi$ of $\mathcal{O}$. Let $\sigma^{\dagger}: \Lambda\left(G_{\infty}\right) \longrightarrow \operatorname{Mat}_{n \times n}(\mathcal{O})$ be the ring homomorphism induced from an Artin representation $\sigma: G_{\infty} \longrightarrow \mathrm{GL}(n, \mathcal{O})$. The continuous group homomorphism $G_{\infty} \longrightarrow \operatorname{Mat}_{n \times n}\left(\mathcal{O} \llbracket \Gamma_{k} \rrbracket\right)$ that sends $g \in G_{\infty}$ to $\sigma^{\dagger}(g) \otimes(g \bmod H)$ extends to a (localised) algebra homomorphism

$$
\Phi_{\sigma}: \Lambda\left(G_{\infty}\right)_{S^{*}} \longrightarrow \operatorname{Mat}_{n \times n}\left(Q_{\mathcal{O}}\left(\Gamma_{k}\right)\right)
$$

where $S^{*}$ is an Ore set, and $Q_{\mathcal{O}}\left(\Gamma_{k}\right)$ is the skew-field of quotients of $\mathcal{O} \llbracket \Gamma_{k} \rrbracket$ (see [1, Lemma 3.3] for details).

For a ring $R$, let $\mathrm{K}_{j}(R)$ denote its $j$-th K-group; then on the level of K-groups, we have

$$
\Phi_{\sigma}^{\prime}: \mathrm{K}_{1}\left(\Lambda\left(G_{\infty}\right)_{S^{*}}\right) \longrightarrow \mathrm{K}_{1}\left(\operatorname{Mat}_{n \times n}\left(Q_{\mathcal{O}}\left(\Gamma_{k}\right)\right)\right) \cong Q_{\mathcal{O}}\left(\Gamma_{k}\right)^{\times}
$$

where the last isomorphism arises by Morita invariance. Returning to our module $M$, its class $[M]$ inside the Grothendieck group $\mathrm{K}_{0}\left(\mathfrak{M}_{H}\left(G_{\infty}\right)\right)$ lifts to an element $\xi_{M}$ under the connecting homomorphism $\partial_{G_{\infty}}: \mathrm{K}_{1}\left(\Lambda\left(G_{\infty}\right)_{S^{*}}\right) \rightarrow \mathrm{K}_{0}\left(\mathfrak{M}_{H}\left(G_{\infty}\right)\right)$ the surjectivity of $\partial$ follows directly from [1, Proposition 3.4], provided the group $G_{\infty}$ has no element of order $p$. Any such lift $\xi_{M}$ is referred to as a characteristic element for $M$.

In preparation for the main result of this section, we shall first introduce some common notation, and then prove an elementary but useful lemma.

Notation: (i) For a topological group $G$, let $R_{p}(G)$ indicate the additive group generated by the $\overline{\mathbb{Q}}_{p}$-valued characters $\chi$ with open kernel; we also write $\operatorname{Irr}(G)$ for the subset of characters from irreducible $G$-representations.
(ii) Recall that at each prime number $p$, the $p$-th Adams operator $\psi_{p}$ acts on $\chi \in R_{p}(G)$ by sending it to the virtual character $\psi_{p} \chi: g \mapsto \chi\left(g^{p}\right)$.
(iii) On choosing a topological generator, we may identify $\mathcal{O} \llbracket \Gamma_{k} \rrbracket$ with the power series ring $\mathcal{O} \llbracket X \rrbracket$. We define $\varphi: \mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)} \rightarrow \mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)}$ to be the map extending $X \mapsto(1+X)^{p}-1$ linearly and continuously.
(iv) For a non-zero element $\mathcal{F} \in \mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)}$, we write $\lambda(\mathcal{F})$ for the $\lambda$-invariant of $\mathcal{F}$, which is the number of zeros minus the number of poles (counted with multiplicity) that $\mathcal{F}$ has as a function on the open unit disk. Similarly, we write $\mu(\mathcal{F})$ for the $\mu$-invariant of $\mathcal{F}$, which is the unique integer $n$ satisfying

$$
\pi^{-n} \mathcal{F} \in \mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)} \backslash \pi \mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)}
$$

Lemma 2.1. Let $\mathcal{F}_{1}$ and $\mathcal{F}_{2}$ be non-zero elements of $\mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)}$ such that both $\mu\left(\mathcal{F}_{1}\right)=\mu\left(\mathcal{F}_{2}\right)=0$ and

$$
\mathcal{F}_{1} \equiv \mathcal{F}_{2} \quad \bmod \pi \mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)}
$$

Then $\lambda\left(\mathcal{F}_{1}\right)=\lambda\left(\mathcal{F}_{2}\right)$.

Proof. For each $i=1,2$, we can express $\mathcal{F}_{i}$ as a power series quotient $f_{i} / g_{i}$ where $f_{i}, g_{i} \in \mathcal{O} \llbracket \Gamma_{k} \rrbracket$ and $\mu\left(f_{i}\right)=\mu\left(g_{i}\right)=0$. Then $\lambda\left(\mathcal{F}_{i}\right)=\lambda\left(f_{i}\right)-\lambda\left(g_{i}\right)$, and from the above congruence

$$
\begin{equation*}
f_{1} g_{2} \equiv f_{2} g_{1} \quad \bmod \pi \mathcal{O} \llbracket \Gamma_{k} \rrbracket \tag{2.1}
\end{equation*}
$$

In general, if $\mathcal{F} \in \mathcal{O} \llbracket \Gamma_{k} \rrbracket \backslash \pi \mathcal{O} \llbracket \Gamma_{k} \rrbracket$ then

$$
\lambda(\mathcal{F})=\operatorname{dim}_{\mathcal{O} / \pi}\left(\mathcal{O} \llbracket \Gamma_{k} \rrbracket /\langle\pi, \mathcal{F}\rangle\right)
$$

However equation (2.1) implies $\left\langle\pi, f_{1} g_{2}\right\rangle$ and $\left\langle\pi, f_{2} g_{1}\right\rangle$ represent the same ideal, in which case $\lambda\left(f_{1} g_{2}\right)$ equals $\lambda\left(f_{2} g_{1}\right)$; as a direct consequence

$$
\lambda\left(\mathcal{F}_{1}\right)=\lambda\left(f_{1}\right)-\lambda\left(g_{1}\right)=\lambda\left(f_{2}\right)-\lambda\left(g_{2}\right)=\lambda\left(\mathcal{F}_{2}\right)
$$

and the required equality is proved.
Theorem 2.2. If $\xi_{M} \in \mathrm{~K}_{1}\left(\Lambda\left(G_{\infty}\right)_{S^{*}}\right)$ denotes a characteristic element for $M$ and $\sigma: G_{\infty} \longrightarrow \operatorname{Aut}_{\mathcal{O}}\left(V_{\sigma}\right)$ is any Artin representation which satisfies the condition $\Phi_{\sigma}^{\prime}\left(\xi_{M}\right) \in \mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)}$, then

$$
\lambda\left(\Phi_{\sigma}^{\prime}\left(\xi_{M}\right)\right)=\sum_{\chi_{i} \in \operatorname{Irr}\left(G_{\infty}\right)} n_{i}(\sigma) \times \lambda\left(\Phi_{\rho_{i}}^{\prime}\left(\xi_{M}\right)\right)
$$

where the constants $n_{i}(\sigma)$ are defined by the decomposition

$$
\psi_{p} \circ \operatorname{Tr}(\sigma)=\sum_{\chi_{i} \in \operatorname{Irr}\left(G_{\infty}\right)} n_{i}(\sigma) \cdot \chi_{i}
$$

with each $\chi_{i}=\operatorname{Tr}\left(\rho_{i}\right)$. (See also [14, Theorem 4.1.6].)
Proof. The congruences of Ritter and Weiss are derived in terms of $p$-adic Lie groups of dimension one, therefore we must first explain how to descend from $G_{\infty}$ to a suitable one-dimensional quotient $G_{\infty, \sigma}^{(1)}$ as follows.

Let $K_{\infty, \sigma}=\overline{\mathbb{Q}}^{\operatorname{Ker}(\sigma)} \cdot k_{\infty}$ be the compositum of the field cut out by $\operatorname{Ker}(\sigma)$ together with the cyclotomic $\mathbb{Z}_{p}$-extension of $k$. In particular, one can decompose

$$
G_{\infty, \sigma}^{(1)}:=\operatorname{Gal}\left(K_{\infty, \sigma} / k\right) \cong \Gamma_{k} \ltimes H_{\sigma}^{(1)}
$$

where $H_{\sigma}^{(1)}$ is obtained as a quotient of $H$. Furthermore $H_{\sigma}^{(1)}$ must be a finite $p$-group because $\operatorname{Im}(\sigma)$ is finite, so $\operatorname{dim}\left(G_{\infty, \sigma}^{(1)}\right)=1$.

We now recall the definition of the Det-homomorphism from [12]. Let $x \in$ $Q\left(G_{\infty, \sigma}^{(1)}\right)^{\times}$and $\chi \in R_{p}\left(G_{\infty, \sigma}^{(1)}\right)$. The action of $x$ gives rise to an automorphism on the $Q_{\overline{\mathbb{Q}}_{p}}\left(\Gamma_{k}\right)$-vector space $\operatorname{Hom}_{\overline{\mathbb{Q}}_{p}\left[H_{\sigma}^{(1)}\right]}\left(V_{\chi}, \overline{\mathbb{Q}}_{p} \otimes_{\mathbb{Q}_{p}} Q\left(G_{\infty, \sigma}^{(1)}\right)\right)$. If one writes $\operatorname{Det}_{\chi}(x) \in Q_{\overline{\mathbb{Q}}_{p}}\left(\Gamma_{k}\right)^{\times}$for the determinant of this action, this allows us to define a map

$$
\begin{aligned}
Q\left(G_{\infty, \sigma}^{(1)}\right)^{\times} & \rightarrow \operatorname{Hom}\left(R_{p}\left(G_{\infty, \sigma}^{(1)}\right), Q_{\overline{\mathbb{Q}}_{p}}\left(\Gamma_{k}\right)^{\times}\right) \\
x & \mapsto\left[\chi \mapsto \operatorname{Det}_{\chi}(x)\right]
\end{aligned}
$$

From $[12, \S 3]$ the map defined in this way is a group homomorphism, and it factors through the projection $Q\left(G_{\infty, \sigma}^{(1)}\right)^{\times} \rightarrow \mathrm{K}_{1}\left(Q\left(G_{\infty, \sigma}^{(1)}\right)\right)$. Its image lies inside a certain
subgroup Hom* $\subset$ Hom, which is described explicitly in [12, Theorem 8]. We shall write

$$
\text { Det }: \mathrm{K}_{1}\left(Q\left(G_{\infty, \sigma}^{(1)}\right)\right) \longrightarrow \operatorname{Hom}^{*}\left(R_{p}\left(G_{\infty, \sigma}^{(1)}\right), Q_{\overline{\mathbb{Q}}_{p}}\left(\Gamma_{k}\right)^{\times}\right)
$$

for the Det-homomorphism given above. Note that if $x \in \Lambda\left(G_{\infty, \sigma}^{(1)}\right)_{(p)}$ and $\chi \in$ $R_{p}\left(G_{\infty, \sigma}^{(1)}\right)$ takes values in $\mathcal{O}$, the determinant $(\operatorname{Det} x)(\chi)$ will in fact belong to $\mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)}$ by [13, proof of Lemma 2].

The crux of our argument is that for $x$ and $\chi$ as above, and enlarging the scalars $\mathcal{O}$ if necessary, one has the modulo $p$ congruence

$$
(\operatorname{Det} x)(\chi)^{p} \equiv \varphi\left(\operatorname{Det}\left(\operatorname{Frob}_{p} x\right)\right)\left(\psi_{p} \circ \chi\right) \quad \bmod p \cdot \mathcal{O} \llbracket \Gamma_{k} \rrbracket_{(\pi)}
$$

which was proven by Ritter and Weiss [13, Proposition 8].
Remarks: (i) If we take $\mathcal{F}_{1}=(\operatorname{Det} x)(\chi)^{p}$ and $\mathcal{F}_{2}=\varphi\left(\operatorname{Det}\left(\operatorname{Frob}_{p} x\right)\right)\left(\psi_{p} \chi\right)$ with $\mu\left(\mathcal{F}_{1}\right)=\mu\left(\mathcal{F}_{2}\right)=0$, then Lemma 2.1 implies

$$
p \times \lambda((\operatorname{Det} x)(\chi))=\lambda\left(\varphi \left(\operatorname{Det}^{\left.\left.\left(\operatorname{Frob}_{p} x\right)\right)\left(\psi_{p} \circ \chi\right)\right)=p \times \lambda\left((\operatorname{Det} x)\left(\psi_{p} \circ \chi\right)\right), ~}\right.\right.
$$

since the effect of the map $\varphi$ is to multiply the $\lambda$-invariant by $p$, whilst the Frobenius action on the coefficients does not change the $\lambda$-invariant.
(ii) Moreover, if $\chi=\operatorname{Tr}(\sigma)$ and $\psi_{p} \circ \chi=\sum_{\chi_{i} \in \operatorname{Irr}\left(G_{\infty}\right)} n_{i}(\sigma) \cdot \chi_{i}$, then by explicit Brauer induction

$$
\lambda\left((\operatorname{Det} x)\left(\psi_{p} \circ \chi\right)\right)=\lambda\left(\prod_{\chi_{i} \in \operatorname{Irr}\left(G_{\infty}\right)}(\operatorname{Det} x)\left(\chi_{i}\right)^{n_{i}(\sigma)}\right)
$$

(iii) Combining the previous two comments, we immediately see that both $\lambda((\operatorname{Det} x)(\chi))$ and $\lambda\left(\prod_{\chi_{i} \in \operatorname{Irr}\left(G_{\infty}\right)}(\operatorname{Det} x)\left(\chi_{i}\right)^{n_{i}(\sigma)}\right)$ are equal.
To complete the proof of the theorem, we must connect the Hom-description with the characteristic element of $M$. From the definition of the map $\Phi_{\sigma}$, clearly it factorises through the first K-group for the localisation of $\Lambda\left(G_{\infty, \sigma}^{(1)}\right)$. In fact, there is a commutative diagram

$$
\begin{aligned}
\Phi_{\sigma}^{\prime}: \mathrm{K}_{1}\left(\Lambda\left(G_{\infty}\right)_{S^{*}}\right) \xrightarrow{\mathrm{pr}_{*}} \mathrm{~K}_{1}\left(\Lambda\left(G_{\infty, \sigma}^{(1)}\right)_{\bar{S}^{*}}\right) \stackrel{\left(\Phi_{\sigma}^{(1)}\right)^{\prime}}{\xrightarrow{\left(\iota^{\prime}\right.}} Q_{\overline{\mathbb{Q}}_{p}}\left(\Gamma_{k}\right)^{\times} \\
\downarrow_{h \mapsto h(\operatorname{Tr}(\sigma))} \\
\mathrm{K}_{1}\left(Q\left(G_{\infty, \sigma}^{(1)}\right)\right) \xrightarrow{\text { Det }} \operatorname{Hom}^{*}\left(R_{p}\left(G_{\infty, \sigma}^{(1)}\right), Q_{\overline{\mathbb{Q}}_{p}}\left(\Gamma_{k}\right)^{\times}\right)
\end{aligned}
$$

where $\iota$ denotes the mapping of an algebra $\Lambda$ into its skew-field of quotients; the homomorphism $\Phi_{\sigma}^{(1)}: \Lambda\left(G_{\infty, \sigma}^{(1)}\right)_{\bar{S}^{*}} \longrightarrow \operatorname{Mat}_{n \times n}\left(Q_{\mathcal{O}}\left(\Gamma_{k}\right)\right)$ is constructed in an identical way to $\Phi_{\sigma}$, with the Lie group $G_{\infty}$ replaced by its one-dimensional quotient.

Let us now take $x=\iota_{*}\left(\operatorname{pr}_{*} \xi_{M}\right)$. Applying this factorisation to $x$ yields

$$
\Phi_{\sigma}^{\prime}\left(\xi_{M}\right)=\left(\Phi_{\sigma}^{(1)}\right)^{\prime} \circ \operatorname{pr}_{*}\left(\xi_{M}\right)=\left.(\operatorname{Det} x)\right|_{\operatorname{Tr}(\sigma)}=(\operatorname{Det} x)(\chi)
$$

and by similar reasoning,

$$
\Phi_{\rho_{i}}^{\prime}\left(\xi_{M}\right)=\left(\Phi_{\rho_{i}}^{(1)}\right)^{\prime} \circ \operatorname{pr}_{*}\left(\xi_{M}\right)=\left.(\operatorname{Det} x)\right|_{\operatorname{Tr}\left(\rho_{i}\right)}=(\operatorname{Det} x)\left(\chi_{i}\right)
$$

Finally, our hypothesis on the $\mu$-invariants of $M$ ensures the vanishing condition in remark (i) is satisfied, hence we obtain

$$
\begin{aligned}
\lambda\left(\Phi_{\sigma}^{\prime}\left(\xi_{M}\right)\right) & =\lambda((\operatorname{Det} x)(\chi)) \stackrel{\text { by }}{=} \text { (iii) }_{=} \lambda\left(\prod_{\chi_{i} \in \operatorname{Irr}\left(G_{\infty}\right)}(\operatorname{Det} x)\left(\chi_{i}\right)^{n_{i}(\sigma)}\right) \\
& =\sum_{\chi_{i}} n_{i}(\sigma) \times \lambda\left((\operatorname{Det} x)\left(\chi_{i}\right)\right)=\sum_{\chi_{i}} n_{i}(\sigma) \times \lambda\left(\Phi_{\rho_{i}}^{\prime}\left(\xi_{M}\right)\right)
\end{aligned}
$$

and the desired equality follows.
2.2. Bounding Mordell-Weil ranks. Let $K_{\infty} / k$ denote a $p$-adic Lie extension given as in the Introduction, and write $k_{n}$ for the $n$-th layer in the $\mathbb{Z}_{p}$-extension $k_{\infty}$ of degree $\left[k_{n}: k\right]=p^{n}$. Suppose $A$ is an abelian variety of dimension $g$ defined over $k$, such that
(A) $A$ has good ordinary reduction at all the primes of $k$ lying above $p$;
(B) $\operatorname{Sel}_{K_{\infty}}(A)^{\vee}:=\operatorname{Hom}_{\text {cont }}\left(\operatorname{Sel}_{K_{\infty}}(A), \mathbb{Q}_{p} / \mathbb{Z}_{p}\right)$ is a torsion $\Lambda\left(G_{\infty}\right)$-module;
(C) As a $\mathbb{Z}_{p} \llbracket X \rrbracket$-module, $\operatorname{Sel}_{K_{n} \cdot k_{\infty}}(A)^{\vee}$ has trivial $\mu$-invariant for all $n \geq 1$.

The second condition is now a standard conjecture in the non-commutative Iwasawa theory of abelian varieties. The third line is equivalent to saying that $\operatorname{Sel}_{K_{\infty}}(A)$ is cofinitely-generated over the ring $\Lambda(H)$, i.e. $\operatorname{Sel}_{K_{\infty}}(A)^{\vee}$ belongs to the category $\mathfrak{M}_{H}\left(G_{\infty}\right)$.

Lemma 2.3. Assume that $G_{\infty}$ has dimension $\leq 3$ (as a p-adic Lie group). Then, $H_{i}\left(H^{\prime}, \operatorname{Sel}_{K_{\infty}}(A)^{\vee}\right)=0$ for $i \geq 1$ where $H^{\prime}$ is any open subgroup of $H$.
Proof. By Pontryagin duality, it is equivalent to show the statement that $H^{i}\left(H^{\prime}, \operatorname{Sel}_{K_{\infty}}(A)\right)=$ 0 for $i \geq 1$.

By assumption $H^{\prime}$ is of dimension $\leq 2$, so the assertion is clear for $i \geq 3$. Likewise, the statement for $i=2$ follows from that for $i=1$ by the same argument as [4, Proposition 2.9]. For $i=1$, it is enough to show that
(a) The maps $\gamma_{w}: J_{v}\left(k_{\infty}\right) \rightarrow J_{w}\left(K_{\infty}\right)^{H}$ are surjective for all $v \in S, w \mid v$ where the set $S$ includes the primes at which $A$ has bad reduction, and also the primes above $p$;
(b) $H^{m}\left(G_{S}\left(K_{\infty}\right), H^{1}\left(G_{\infty}, A\left[p^{\infty}\right]\right)\right)=0$ for $m \geq 1$.

Here $J_{v}\left(k_{\infty}\right)=H^{1}\left(k_{\infty, v}, A\right)(p)$, with a similar definition for $J_{w}\left(K_{\infty}\right)$.
We first prove (a). As in [4, proof of Lemma 2.3], we have

$$
\operatorname{coker}\left(\gamma_{w}\right)=H^{2}\left(D_{w / v}, A\left[p^{\infty}\right]\right)=0
$$

by Tate local duality when $v \nmid p$, where $D_{w / v}$ is the decomposition group of $w$ over $v$. For finite places $v \mid p$,

$$
\operatorname{coker}\left(\gamma_{w}\right)=H^{2}\left(D_{w / v}, \tilde{A}_{w}\left[p^{\infty}\right]\right)
$$

with $\tilde{A}_{w}$ indicating the reduction of the abelian variety at $w$. If $\hat{A}$ denotes the formal group associated to $A$ at $w$, there is an exact sequence

$$
\cdots \rightarrow H^{2}\left(D_{w / v}, A\left[p^{\infty}\right]\right) \rightarrow H^{2}\left(D_{w / v}, \tilde{A}_{w}\left[p^{\infty}\right]\right) \rightarrow H^{3}\left(D_{w / v}, \hat{A}\left[p^{\infty}\right]\right) \rightarrow \cdots
$$

and $H^{2}\left(D_{w / v}, A\left[p^{\infty}\right]\right)=H^{3}\left(D_{w / v}, \hat{A}\left[p^{\infty}\right]\right)$; however $H^{3}\left(D_{w / v}, \hat{A}\left[p^{\infty}\right]\right)=0$ as $D_{w / v}$ has $p$-cohomological dimension $\leq 2$, thence (a) follows.

We may prove (b) in the same way as [4, Lemma 2.4].

Lemma 2.4. Let $M=\operatorname{Sel}_{K_{\infty}}(A)^{\vee}$, and $K$ a finite subextension of $K_{\infty} / k$ with Galois group $G=\operatorname{Gal}(K / k)$. If $M_{K}$ denotes the $\mathrm{Gal}\left(K_{\infty} / K \cdot k_{\infty}\right)$-coinvariants of $M$, then

$$
\lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{k} \rrbracket}\left(\Phi_{\mathrm{reg}_{G}}^{\prime}\left(\xi_{M}\right)\right)=\left[K \cap k_{\infty}: k\right] \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K} \rrbracket}\left(M_{K}\right)
$$

where $\operatorname{reg}_{G}$ is the regular representation of $G$, and $\Gamma_{K}$ indicates the Galois group $\operatorname{Gal}\left(K \cdot k_{\infty} / K\right)$.

Proof. Recall from [1, Lemma 3.7], there is a commutative diagram

Here $\rho: G_{\infty} \longrightarrow \operatorname{Aut}_{\mathcal{O}}(V)$ denotes any fixed Artin representation, the Akashi series is given by the alternating product

$$
\operatorname{Ak}_{\mathcal{O}}(\mathcal{P}):=\prod_{i \geq 0} \operatorname{char}_{\Lambda_{\mathcal{O}}\left(\Gamma_{k}\right)}\left(H_{i}(H, \mathcal{P})\right)^{(-1)^{i}} \bmod \mathcal{O} \llbracket \Gamma_{k} \rrbracket^{\times}
$$

while tw $\hat{\rho}: \mathfrak{M}_{H}\left(G_{\infty}\right) \rightarrow \mathfrak{M}_{H}\left(G_{\infty}\right)$ is the (contragredient) $\rho$-twist operator.
Let us now take $\rho$ to be $\operatorname{reg}_{G}$ (with $\mathcal{O}=\mathbb{Z}_{p}$ ), and set

$$
H^{\prime}=H \cap \operatorname{Gal}\left(K_{\infty} / K\right)=\operatorname{Gal}\left(K_{\infty} / K \cdot k_{\infty}\right)
$$

By Lemma 2.3 we have for all $i \geq 1$ that $H_{i}\left(H^{\prime}, \operatorname{Sel}_{K_{\infty}}(A)^{\vee}\right)=0$, which implies $H_{i}\left(H^{\prime}, \operatorname{tw}_{\hat{\rho}}(M)\right)=0$. Therefore $H_{i}\left(H, \operatorname{tw}_{\hat{\rho}}(M)\right)$ is a $p$-group of exponent dividing $\left[H: H^{\prime}\right]$, and its characteristic power series must be of the form $p^{\mu_{i}} \times$ (a unit of $\Lambda\left(\Gamma_{k}\right)$ ) with $\mu_{i} \in \mathbb{Z}_{\geq 0}$. Thus

$$
\begin{aligned}
\Phi_{\rho}^{\prime}\left(\xi_{M}\right) & \equiv \operatorname{Ak}_{\mathbb{Z}_{p}}\left(\operatorname{tw}_{\widehat{\rho}}(M)\right) \\
& \equiv p^{\sum_{i}(-1)^{i} \mu_{i}} \times \operatorname{char}_{\mathbb{Z}_{p} \llbracket \Gamma_{k} \rrbracket}\left(H_{0}\left(H, \operatorname{tw}_{\widehat{\rho}}(M)\right)\right) \quad \bmod \mathbb{Z}_{p} \llbracket \Gamma_{k} \rrbracket^{\times}
\end{aligned}
$$

If $\Gamma^{\prime}=\operatorname{Gal}\left(K \cap k_{\infty} / k\right)$, then since $G_{\infty} \cong \Gamma_{k} \ltimes H$ one has $G \cong \Gamma^{\prime} \ltimes H / H^{\prime}$. Using Frobenius reciprocity and Shapiro's lemma:

$$
\begin{aligned}
H_{0}\left(H, M \otimes \operatorname{reg}_{G}\right) & \cong H_{0}\left(H, M \otimes \operatorname{Ind}_{H^{\prime}}^{H}\left(\operatorname{reg}_{\Gamma^{\prime}}\right)\right) \\
& \cong H_{0}\left(H, \operatorname{Ind}_{H^{\prime}}^{H}\left(M \otimes \operatorname{reg}_{\Gamma^{\prime}}\right)\right) \\
& \cong H_{0}\left(H^{\prime}, M\right) \otimes \operatorname{reg}_{\Gamma^{\prime}} .
\end{aligned}
$$

Therefore one can deduce

$$
\lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{k} \rrbracket}\left(H_{0}\left(H, \operatorname{tw}_{\hat{\rho}}(M)\right)\right)=\# \Gamma^{\prime} \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n}} \rrbracket}\left(M_{H^{\prime}}\right)
$$

and it follows that

$$
\lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{k} \rrbracket}\left(\Phi_{\rho}^{\prime}\left(\xi_{M}\right)\right)=\# \Gamma^{\prime} \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K} \rrbracket}\left(M_{K}\right)
$$

as required.
We now assume that there exists a a filtration of normal subgroups

$$
\begin{equation*}
G_{\infty}=\Sigma_{0} \supset \Sigma_{1} \supset \cdots \supset \Sigma_{n} \supset \ldots \tag{2.2}
\end{equation*}
$$

such that $\# G_{n}=p^{d n}$ and $K_{n} \cap k_{\infty}=k_{n}$ for all $n \geq 0$, where $G_{n}$ and $K_{n}$ are defined as $G_{\infty} / \Sigma_{n}$ and $K_{\infty}^{\Sigma_{n}}$ respectively.

Lemma 2.5. If $\Sigma_{n}=\Sigma_{n-1}^{p}$ for some $n \geq 1$, then

$$
\psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{G_{n}}\right)=p^{d} \times \operatorname{Tr}\left(\operatorname{reg}_{G_{n-1}}\right)
$$

Proof. Recall that if $G$ is a finite group, then

$$
\operatorname{Tr}\left(\operatorname{reg}_{G}\right)(g)= \begin{cases}0 & \text { if } g \neq 1 \\ \# G & \text { if } g=1\end{cases}
$$

In particular, for $g \in G_{\infty}$

$$
\psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{G_{n}}\right)(g)=\operatorname{Tr}\left(\operatorname{reg}_{G_{n}}\right)\left(g^{p}\right)= \begin{cases}0 & \text { if } g^{p} \notin \Sigma_{n} \\ \# G_{n} & \text { if } g^{p} \in \Sigma_{n}\end{cases}
$$

whereas

$$
\operatorname{Tr}\left(\operatorname{reg}_{G_{n-1}}\right)(g)= \begin{cases}0 & \text { if } g \notin \Sigma_{n-1} \\ \# G_{n-1} & \text { if } g \in \Sigma_{n-1}\end{cases}
$$

The result follows from the fact $p^{d} \times \# G_{n-1}=\# G_{n}$.
Theorem 2.6. Assume that $G_{\infty}$ is a p-adic Lie group of dimension $d \leq 3$ with no p-torsion, and that the filtration (2.2) exists. If $K_{\infty}$ is as above and there exists an integer $n_{0}$ such that $\Sigma_{n}=\Sigma_{n-1}^{p}$ for all $n \geq n_{0}+1$, then

$$
\operatorname{rank}_{\mathbb{Z}}\left(A\left(K_{n}\right)\right) \leq C_{A, G_{\infty}} \times p^{(d-1) n}+\delta_{A, G_{\infty}}
$$

where $C_{A, G_{\infty}}=p^{-(d-1) n_{0}} \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n_{0}}} \rrbracket}\left(\operatorname{Sel}_{K_{\infty}}(A)_{H \cap \Sigma_{n_{0}}}^{\vee}\right)$ and $\delta_{A, G_{\infty}} \leq(2 g)^{2}$ are both constants independent of $n$.

Proof. Let $M=\operatorname{Sel}_{K_{\infty}}(A)^{\vee}$ and write $M_{n}=M_{H \cap \Sigma_{n}}$. From Theorem 2.2 and Lemma 2.5, it follows that

$$
\lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{k} \rrbracket}\left(\Phi_{\mathrm{reg}_{G_{n}}^{\prime}}^{\prime}\left(\xi_{M}\right)\right)=p^{d} \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{k} \rrbracket}\left(\Phi_{\mathrm{reg}_{G_{n-1}}}^{\prime}\left(\xi_{M}\right)\right) .
$$

Now taking $K$ to be $K_{n}$ and $K_{n-1}$ in Lemma 2.4 respectively, one deduces

$$
p^{n} \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n}} \rrbracket}\left(M_{n}\right)=p^{d} \times p^{n-1} \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n-1}} \rrbracket}\left(M_{n-1}\right)
$$

thence for $n \geq n_{0}$,

$$
\lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n}} \rrbracket}\left(M_{n}\right)=p^{d-1} \times \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n-1}} \rrbracket}\left(M_{n-1}\right) .
$$

As a direct corollary, we obtain the upper bound

$$
\lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n}} \rrbracket}\left(M_{n}\right) \leq C_{A, G_{\infty}} \times p^{(d-1) n} .
$$

The kernel of the natural restriction map

$$
H^{1}\left(K_{n} \cdot k_{\infty}, A\left[p^{\infty}\right]\right) \xrightarrow{\delta_{n}} H^{1}\left(K_{\infty}, A\left[p^{\infty}\right]\right)^{\operatorname{Gal}\left(K_{\infty} / K_{n} \cdot k_{\infty}\right)}
$$

is equal to $H^{1}\left(K_{\infty} / K_{n} \cdot k_{\infty}, A\left(K_{\infty}\right)\left[p^{\infty}\right]\right)$. We claim that its $\mathbb{Z}_{p}$-corank is bounded by some constant $\delta_{A, G_{\infty}} \leq(2 g)^{2}$, independent of $n$. (This follows from the fact that $\operatorname{Gal}\left(K_{\infty} / K_{n} \cdot k_{\infty}\right)$ is either abelian or isomorphic to a subgroup of $\langle x, y:[x, y]=$ $\left.y^{p^{s}}\right\rangle$ where $s \in \mathbb{N}$ by [7, Proposition 7.1], hence it contains a normal subgroup of dimension 1 ; also the $\mathbb{Z}_{p}$-corank of $A\left(K_{\infty}\right)\left[p^{\infty}\right]$ is at most $2 g$.) Therefore, the $\mathbb{Z}_{p}$-corank of the kernel of the homomorphism

$$
\operatorname{Sel}_{K_{n} \cdot k_{\infty}}(A) \xrightarrow{\text { res }} \operatorname{Sel}_{K_{\infty}}(A)^{\operatorname{Gal}\left(K_{\infty} / K_{n} \cdot k_{\infty}\right)}
$$

is also bounded by $\delta_{A, G_{\infty}}$. Moreover, by Mazur's control theorem [11]

$$
\operatorname{corank}_{\mathbb{Z}_{p}} \operatorname{Sel}_{K_{n}}(A)=\operatorname{corank}_{\mathbb{Z}_{p}} \operatorname{Sel}_{K_{n} \cdot k_{\infty}}(A)^{\Gamma_{K_{n}}} \leq \lambda_{\mathbb{Z}_{p} \llbracket \Gamma_{K_{n}} \rrbracket}\left(\operatorname{Sel}_{K_{n} \cdot k_{\infty}}(A)\right)
$$

so one can deduce

$$
\operatorname{corank}_{\mathbb{Z}_{p}} \operatorname{Sel}_{K_{n}}(A) \leq C_{A, G_{\infty}} \times p^{(d-1) n}+\delta_{A, G_{\infty}}
$$

Lastly if $\operatorname{III}\left(A / K_{n}\right)$ denotes the Tate-Shafarevich group of $A$ over $K_{n}$, then

$$
\begin{aligned}
\operatorname{rank}_{\mathbb{Z}}\left(A\left(K_{n}\right)\right) & \leq \operatorname{rank}_{\mathbb{Z}}\left(A\left(K_{n}\right)\right)+\operatorname{corank}_{\mathbb{Z}_{p}}\left(\operatorname{III}\left(A / K_{n}\right)\left[p^{\infty}\right]\right) \\
& =\operatorname{corank}_{\mathbb{Z}_{p}} \operatorname{Sel}_{K_{n}}(A) \\
& \leq C_{A, G_{\infty}} \times p^{(d-1) n}+\delta_{A, G_{\infty}}
\end{aligned}
$$

as required.

## 3. The two-dimensional case

Let $A / k$ be an abelian variety satisfying conditions (A)-(C) in $\S 2.2$, with the dimension of $G_{\infty}$ equal to 2 . We shall show that the filtration as specified in (2.2), with the property that $\Sigma_{n}=\Sigma_{n-1}^{p}$ for all $n \geq 1$, exists. We recall that one has the following result from [7, Proposition 7.1] and [9, §7.3].

Theorem 3.1. If $G_{\infty}$ is 2-dimensional then $G_{\infty}$ is isomorphic either to $\mathbb{Z}_{p} \times \mathbb{Z}_{p}$, or instead to

$$
G(s):=\left(\begin{array}{cc}
1 & \mathbb{Z}_{p} \\
0 & 1+p^{s} \mathbb{Z}_{p}
\end{array}\right)
$$

for some integer $s \in \mathbb{N}$.
When $G_{\infty} \cong \mathbb{Z}_{p}^{2}$, we may simply take $\Sigma_{n}$ to be the subgroup corresponding to $\left(p^{n} \mathbb{Z}_{p}\right)^{2}$ for $n \geq 0$. We shall therefore concentrate on the non-abelian case. Note that $G(s)$ is an open subgroup of $G(1)$ for all $s \in \mathbb{N}$. Therefore, without loss of generality, we may assume that $G_{\infty} \cong G(1)$; in this case one may realise $K_{\infty}$ as a Lie subextension of the false-Tate curve extension $k\left(\mu_{p^{\infty}}, m^{1 / p^{\infty}}\right)$ where $m>0$ is some $p$-power-free integer.

Remark: A bound on the Mordell-Weil rank for the false-Tate extension (when $A$ is an elliptic curve) was first obtained by Hachimori and Venjakob [8, Corollary 2.9] who applied results of Matsuno [10] on finite $\Lambda$-submodules in Selmer groups, albeit without explicitly determining $C_{A, K_{\infty}}$ below. The proof we present here is based purely on the 'algebraic shape' of $\mathrm{K}_{1}\left(\Lambda\left(G_{\infty}\right)_{S^{*}}\right)$, and instead uses the finite-dimensional representation theory of the underlying Galois group.

We now identify $G_{\infty}$ with $G(1)$, and define

$$
\Sigma_{n}=\left(\begin{array}{cc}
1 & p^{n} \mathbb{Z}_{p} \\
0 & 1+p^{n+1} \mathbb{Z}_{p}
\end{array}\right)
$$

at each $n \geq 0$. Then $\left[\Sigma_{n-1}: \Sigma_{n}\right]=p^{2}$ for every $n \geq 1$, and it can be checked that $\Sigma_{n}$ is a normal subgroup of $G_{\infty}$.

Lemma 3.2. For $n \geq 1$, we have $\Sigma_{n}=\Sigma_{n-1}^{p}$.

Proof. Writing $g=\left(\begin{array}{ll}1 & b \\ 0 & a\end{array}\right) \in G_{\infty}$, one computes

$$
g^{p}=\left(\begin{array}{cc}
1 & \left(a^{p-1}+\cdots+a+1\right) b \\
0 & a^{p}
\end{array}\right) .
$$

If $g \in \Sigma_{n-1}$, then $a \in 1+p^{n} \mathbb{Z}_{p}$ and $b \in p^{n-1} \mathbb{Z}_{p}$. In particular, $a \equiv 1 \bmod p$ so $a^{p-1}+\cdots+a+1 \equiv 0 \bmod p$; therefore $g^{p} \in \Sigma_{n}$.

Conversely, if $g \in \Sigma_{n}$, we have $a \in 1+p^{n+1} \mathbb{Z}_{p}$ and we may find $a_{0} \in 1+p^{n} \mathbb{Z}_{p}$ such that $a_{0}^{p}=a$. Moreover $a_{0}^{p-1}+\cdots+1 \equiv p \bmod p^{2}$, so we may find $b_{0} \in p^{n-1} \mathbb{Z}_{p}$ such that $\left(a_{0}^{p-1}+\cdots+1\right) b_{0}=b$. In other words,

$$
g_{0}=\left(\begin{array}{ll}
1 & b_{0} \\
0 & a_{0}
\end{array}\right) \in \Sigma_{n-1} \quad \text { and } \quad g_{0}^{p}=g .
$$

Recall from the previous section that $K_{n}$ is the fixed field of $K_{\infty}$ under $\Sigma_{n}$.
Lemma 3.3. For all $n \geq 0$, one has $K_{n} \cap k_{\infty}=k_{n}$.
Proof. Via the semi-direct product $G_{\infty}=\Gamma_{k} \ltimes H$, we can identify $\Gamma_{k}$ as a subgroup of $G_{\infty}$. The assertion in the lemma is then equivalent to the equality $\left[\Gamma_{k}: \Gamma_{k} \cap \Sigma_{n}\right]=$ $p^{n}$. By Lemma 3.2 one has $\Sigma_{n}=G_{\infty}^{p^{n}}$, therefore

$$
\Gamma_{k} \cap \Sigma_{n}=\Gamma_{k}^{p^{n}}
$$

which clearly has index $p^{n}$ in $\Gamma_{k}$.
Theorem 3.4. There is an asymptotic bound

$$
\operatorname{rank}_{\mathbb{Z}}\left(A\left(K_{n}\right)\right) \leq C_{A, K_{\infty}} \times p^{n} \quad \text { at all integers } n \geq 0,
$$

for the given constant $C_{A, K_{\infty}}=\lambda_{\mathbb{Z}_{p}\left[\Gamma_{k}\right]}\left(\operatorname{Sel}_{K_{\infty}}(A)_{H}^{\vee}\right)$.
Proof. By Lemmas 3.2 and 3.3, it is enough to show the term $\delta_{A, G_{\infty}}$ in Theorem 2.6 vanishes in this setting. Recall from the proof of the theorem that $\delta_{A, G_{\infty}}$ is the $\mathbb{Z}_{p}$-corank of $H^{1}\left(K_{\infty} / k_{\infty}, A\left(K_{\infty}\right)\left[p^{\infty}\right]\right)$, and the latter group turns out to be finite by a natural generalisation of [8, Lemma 3.3].

## 4. The three-dimensional case

Let $A / k$ be an abelian variety satisfying conditions (A)-(C) in $\S 2.2$, with the dimension of $G_{\infty}$ equal to 3 . We remark that $G_{\infty}$ is soluble (because $G_{\infty} / H \cong \Gamma$ and $H$ is of dimension 2, which is soluble using Theorem 3.1); in particular, this excludes $\mathrm{SL}\left(2, \mathbb{Z}_{p}\right)$ and $\mathrm{SL}\left(1, \mathbb{D}_{p}\right)$ from appearing.

Let us review the classification of such soluble groups, as is discussed at length in $\left[7\right.$, Theorem 7.4]. We shall write $\mathbb{N}_{0}$ for the set of non-negative integers $\mathbb{Z}_{\geq 0}$.

Theorem 4.1. If $G_{\infty}$ is soluble and torsion-free, then $G_{\infty}$ is isomorphic to one of the following groups:
(1) the abelian group $\mathbb{Z}_{p}^{3}$;
(2) an open subgroup of the Heisenberg group, i.e. a group represented by $\left\langle x, y_{1}, y_{2}:\left[y_{1}, y_{2}\right]=1,\left[y_{1}, x\right]=1,\left[y_{2}, x\right]=y_{1}^{p^{s}}\right\rangle$ for some $s \in \mathbb{N}_{0}$;
(3) $\left\langle x, y_{1}, y_{2}:\left[y_{1}, y_{2}\right]=1,\left[y_{1}, x\right]=y_{1}^{p^{s}},\left[y_{2}, x\right]=y_{2}^{p^{s}}\right\rangle$ for some $s \in \mathbb{N}$;
(4) $\left\langle x, y_{1}, y_{2}:\left[y_{1}, y_{2}\right]=1,\left[y_{1}, x\right]=y_{1}^{p^{s}} y_{2}^{p^{s+r}},\left[y_{2}, x\right]=y_{1}^{p^{s+r}} y_{2}^{p^{s}}\right\rangle$ for some $s, r \in \mathbb{N}$ and $d \in \mathbb{Z}_{p} ;$
(5) $\left\langle x, y_{1}, y_{2}:\left[y_{1}, y_{2}\right]=1,\left[y_{1}, x\right]=y_{2}^{p^{s} d},\left[y_{2}, x\right]=y_{1}^{p^{s}} y_{2}^{p^{s+r}}\right\rangle$ where $s, r \in \mathbb{N}_{0}$ and $d \in \mathbb{Z}_{p}$, such that either $s \geq 1$, or $r \geq 1$ and $d \in p \mathbb{Z}_{p}$;
(6) either one of $\left\langle x, y_{1}, y_{2}:\left[y_{1}, y_{2}\right]=1,\left[y_{1}, x\right]=y_{2}^{p^{s+r}},\left[y_{2}, x\right]=y_{1}^{p^{s}}\right\rangle$ or $\left\langle x, y_{1}, y_{2}:\left[y_{1}, y_{2}\right]=1,\left[y_{1}, x\right]=y_{2}^{p^{s+r} t},\left[y_{2}, x\right]=y_{1}^{p^{s}}\right\rangle$ where $s, r \in \mathbb{N}_{0}$ with $s+r \geq 1$ and $t \in \mathbb{Z}_{p}^{\times}$is not a square modulo $p$.

As an illustration, in case (3) if $k$ contains the $p$-th roots of unity then $K_{\infty}$ may be realised as an extension of the type

$$
k\left(\mu_{p \infty}, m_{1}^{1 / p^{\infty}}, m_{2}^{1 / p^{\infty}}\right)
$$

where $p, m_{1}, m_{2}$ are pairwise coprime as integers. Since the abelian case is well understood, we only consider cases (2)-(6) here. Let

$$
\Sigma_{n}=\left\langle x^{p^{n}}, y_{1}^{p^{n}}, y_{2}^{p^{n}}\right\rangle
$$

Our main goal is to show that these subgroups satisfy the condition given by Lemma 2.5, namely

Theorem 4.2. For $n \geq 3$, we have $\Sigma_{n-1}^{p}=\Sigma_{n}$ and $\left[\Sigma_{n-1}: \Sigma_{n}\right]=p^{3}$. Moreover, $K_{n} \cap k_{\infty}=k_{n}$.

In particular, this would give us the required asymptotic bounds on the $\mathbb{Z}$-rank of $A\left(K_{n}\right)$ by Theorem 2.6:

Theorem 4.3. There is an asymptotic bound

$$
\operatorname{rank}_{\mathbb{Z}}\left(A\left(K_{n}\right)\right) \leq C_{A, G_{\infty}} \times p^{2 n}+\delta_{A, G_{\infty}} \quad \text { at all integers } n \geq 2
$$

where $\delta_{A, G_{\infty}} \leq(2 g)^{2}$ and $C_{A, G_{\infty}} \geq 0$.
4.1. Preliminary results on commutators. We write $Y=\left\langle y_{1}, y_{2}\right\rangle \cong \mathbb{Z}_{p}^{\oplus 2}$ (since $\left[y_{1}, y_{2}\right]=1$ ), so that

$$
\begin{equation*}
\left[x, y_{i}\right] \in Y \quad \text { at each } i=1,2 \tag{4.1}
\end{equation*}
$$

Lemma 4.4. For $i=1,2$ and $\alpha \in \mathbb{Z}_{p}$, we have $\left[x^{\alpha}, y_{i}\right] \in Y$. Moreover,

$$
\left[x^{\alpha}, y_{i}^{\beta}\right]=\left[x^{\alpha}, y_{i}\right]^{\beta} \quad \text { for all } \beta \in \mathbb{Z}_{p}
$$

Proof. By (4.1), we have $x Y x^{-1}=Y$. This implies $x^{n} Y x^{-n}=Y$ for all $n \in \mathbb{Z}$, hence the first statement follows by continuity.

Let $x^{\alpha} y_{i} x^{-\alpha}=y \in Y$. Then $\left[x^{\alpha}, y_{i}\right]=y y_{i}^{-1} \in Y$, but $Y$ is abelian so

$$
x^{\alpha} y_{i}^{\beta} x^{-\alpha}=y^{\beta} \quad \text { and } \quad\left[x^{\alpha}, y_{i}^{\beta}\right]=y^{\beta} y_{i}^{-\beta}=\left[x^{\alpha}, y_{i}\right]^{\beta}
$$

and the second statement is true.
In particular, we see that $Y^{p^{n}}$ is a normal subgroup of $G_{\infty}$ for all $n \geq 0$. For $\alpha \in \mathbb{Z}_{p}$, there exist $a_{n}, b_{n}, c_{n}, d_{n} \in \mathbb{Z}_{p}$ (depending on $\alpha$ ) such that

$$
\left[x^{n \alpha}, y_{1}\right]=y_{1}^{a_{n}} y_{2}^{b_{n}}, \quad\left[x^{n \alpha}, y_{2}\right]=y_{1}^{c_{n}} y_{2}^{d_{n}}
$$

for all integers $n \in \mathbb{N}$. We have the following recurrence relations.

Lemma 4.5. For all integers $n \geq 1$,

$$
\begin{array}{rll}
a_{n+1}=\left(a_{1}+1\right) a_{n}+c_{1} b_{n}+a_{1} ; & & b_{n+1}=\left(d_{1}+1\right) b_{n}+b_{1} a_{n}+b_{1} \\
c_{n+1}=\left(a_{1}+1\right) c_{n}+c_{1} d_{n}+c_{1} ; & & d_{n+1}=\left(d_{1}+1\right) d_{n}+b_{1} c_{n}+d_{1}
\end{array}
$$

Proof. One computes via Lemma 4.4,

$$
\begin{aligned}
{\left[x^{(n+1) \alpha}, y_{1}\right] } & =x^{(n+1) \alpha} y_{1} x^{-(n+1) \alpha} y_{1}^{-1} \\
& =x\left[x^{n \alpha}, y_{1}\right] x^{-1}\left[x, y_{1}\right] \\
& =x y_{1}^{a_{n}} y_{2}^{b_{n}} x^{-1}\left[x, y_{1}\right] \\
& =\left[x, y_{1}^{a_{n}}\right] y_{1}^{a_{n}}\left[x, y_{2}^{b_{n}}\right] y_{2}^{b_{n}}\left[x, y_{1}\right] \\
& =\left[x, y_{1}\right]^{a_{n}} y_{1}^{a_{n}}\left[x, y_{2}\right]^{b_{n}} y_{2}^{b_{n}}\left[x, y_{1}\right]
\end{aligned}
$$

which implies the first two equations. The last two can be obtained similarly.
Corollary 4.6. For all $n \in \mathbb{N}, a_{n}, b_{n}, d_{n} \equiv 0 \bmod p$ and $c_{n} \equiv n c_{1} \bmod p$.
Proof. By definition, $a_{1}, b_{1}, d_{1} \equiv 0 \bmod p$. Thus we deduce by induction that $a_{n}, b_{n}, d_{n} \equiv 0$ and $c_{n+1} \equiv c_{n}+c_{1} \bmod p$.

Lemma 4.7. If $\alpha \in p \mathbb{Z}_{p}$, then $\left[x^{\alpha}, y_{i}\right] \in Y^{p}$ at each $i=1,2$.
Proof. By Corollary 4.6,

$$
\left[x^{n}, y_{1}\right] \in Y^{p} \quad \text { and } \quad\left[x^{n}, y_{2}\right] \in\left\langle y_{1}^{p}, y_{2}^{p}\right\rangle=Y^{p} \quad \text { at every } n \in p \mathbb{N}
$$

Hence using continuity arguments again, one obtains

$$
\left[x^{\alpha}, y_{1}\right] \in Y^{p} \quad \text { and } \quad\left[x^{\alpha}, y_{2}\right] \in Y^{p}
$$

for all $\alpha \in p \mathbb{Z}_{p}$; the result now follows.
Lemma 4.8. If $\alpha, \beta, \gamma \in \mathbb{Z}_{p}$ and $n \in \mathbb{N}$, then

$$
\begin{aligned}
& \left(x^{\alpha} y_{1}^{\beta} y_{2}^{\gamma}\right)^{n}=x^{n \alpha} y_{1}^{n \beta} y_{2}^{n \gamma} \prod_{i=1}^{n-1}\left(\left[y_{1}^{-\beta}, x^{-i \alpha}\right]\left[y_{2}^{-\gamma}, x^{-i \alpha}\right]\right) \\
& \left(y_{1}^{\beta} y_{2}^{\gamma} x^{\alpha}\right)^{n}=\prod_{i=1}^{n-1}\left(\left[x^{i \alpha}, y_{1}^{\beta}\right]\left[x^{i \alpha}, y_{2}^{\gamma}\right]\right) y_{1}^{n \beta} y_{2}^{n \gamma} x^{n \alpha}
\end{aligned}
$$

Proof. One calculates that

$$
\begin{aligned}
x^{\alpha} y_{1}^{\beta} y_{2}^{\gamma} x^{n \alpha} & =x^{\alpha} y_{1}^{\beta} x^{n \alpha} y_{2}^{\gamma}\left[y_{2}^{-\gamma}, x^{-n \alpha}\right] \\
& =x^{(n+1) \alpha} y_{1}^{\beta}\left[y_{1}^{-\beta}, x^{-n \alpha}\right] y_{2}^{\gamma}\left[y_{2}^{-\gamma}, x^{-n \alpha}\right]
\end{aligned}
$$

Therefore, upon applying Lemma 4.4

$$
\begin{aligned}
& \left(x^{\alpha} y_{1}^{\beta} y_{2}^{\gamma}\right) x^{n \alpha} y_{1}^{n \beta} y_{2}^{n \gamma} \prod_{i=1}^{n-1}\left(\left[y_{1}^{-\beta}, x^{-i \alpha}\right]\left[y_{2}^{-\gamma}, x^{-i \alpha}\right]\right) \\
= & x^{(n+1) \alpha} y_{1}^{(n+1) \beta} y_{2}^{(n+1) \gamma} \prod_{i=1}^{n}\left(\left[y_{1}^{-\beta}, x^{-i \alpha}\right]\left[y_{2}^{-\gamma}, x^{-i \alpha}\right]\right)
\end{aligned}
$$

and the first equation follows inductively. The second one can be proved similarly.

Lemma 4.9. Let $n \geq 0$ be an integer. If $\alpha \in p^{n} \mathbb{Z}_{p}$, then

$$
\left[x^{\alpha}, y_{i}\right] \in Y^{p^{n}} \quad \text { for both } i=1,2
$$

Proof. We prove this by induction. When $n=0$, there is nothing to prove and the case $n=1$ is given by Lemma 4.7.

Assume that the statement is true for $n-1$ where $n \geq 2$, and let $\alpha \in p^{n} \mathbb{Z}_{p}$. From the inductive hypothesis, there exists $y=y_{1}^{\beta} y_{2}^{\gamma} \in Y^{p^{n-2}}$ such that $\left[x^{\alpha / p}, y_{i}\right]=y^{p}$, so $y_{i}^{-1} x^{\alpha / p} y_{i}=y^{p} x^{\alpha / p}$. As a straight consequence,

$$
\begin{aligned}
y_{i}^{-1} x^{\alpha} y_{i} & =\left(y_{1}^{p \beta} y_{2}^{p \gamma} x^{\alpha / p}\right)^{p} \\
& =\prod_{n=1}^{p-1}\left(\left[x^{n \alpha / p}, y_{1}^{p \beta}\right]\left[x^{n \alpha / p}, y_{2}^{p \gamma}\right]\right) y_{1}^{p^{2} \beta} y_{2}^{p^{2} \gamma} x^{\alpha} \\
& =\left(\prod_{n=1}^{p-1}\left[x^{n \alpha / p}, y_{1}^{\beta}\right]\left[x^{n \alpha / p}, y_{2}^{\gamma}\right]\right)^{p} y^{p^{2}} x^{\alpha}
\end{aligned}
$$

upon using Lemmas 4.8 and 4.4. Furthermore, the inductive hypothesis implies

$$
\left[x^{n \alpha / p}, y_{1}^{\beta}\right],\left[x^{n \alpha / p}, y_{2}^{\gamma}\right] \in Y^{p^{n-1}} \quad \text { for all } n \in \mathbb{Z}
$$

therefore there exists $y^{\prime} \in Y^{p^{n-2}}$ such that

$$
y_{i}^{-1} x^{\alpha} y_{i}=\left(y^{\prime} y\right)^{p^{2}} x^{\alpha}
$$

One concludes $\left[x^{\alpha}, y_{i}\right] \in Y^{p^{n}}$, so the statement of the lemma is true.
Corollary 4.10. For all $n \geq 0, \Sigma_{n}$ is a normal subgroup of $G_{\infty}$.
Proof. Let $i \in\{1,2\}$; Lemma 4.4 tells us that $x y_{i}^{p^{n}} x^{-1} \in \Sigma_{n}$ whereas Lemma 4.9 implies $y_{i} x^{p^{n}} y_{i}^{-1} \in \Sigma_{n}$, from which the result follows.
4.2. Proof of Theorem 4.2. Let us first give an explicit description for the elements of $\Sigma_{n}$.
Lemma 4.11. For all integers $n \geq 0$, the group $\Sigma_{n}$ coincides with the set

$$
\left\{x^{\alpha} y_{1}^{\beta} y_{2}^{\gamma}: \alpha, \beta, \gamma \in p^{n} \mathbb{Z}_{p}\right\}
$$

Proof. Let $\alpha, \beta \in p^{n} \mathbb{Z}_{p}$ and $i \in\{1,2\}$. Then by Lemma 4.4, we have

$$
\begin{aligned}
y_{i}^{\beta} x^{\alpha} & =x^{\alpha} y_{i}^{\beta}\left[y_{i}^{-\beta}, x^{-\alpha}\right] \\
& =x^{\alpha} y_{i}^{\beta}\left[x^{-\alpha}, y_{i}\right]^{-\beta} \in x^{\alpha} Y^{p^{n}}
\end{aligned}
$$

Thus every word in $x^{p^{n}}$ and $y_{i}^{p^{n}}$ can be written as $x^{\alpha} y$, for some $\alpha \in p^{n} \mathbb{Z}_{p}$ and $y \in Y^{p^{n}}$.

This clearly implies $\left[\Sigma_{n-1}: \Sigma_{n}\right]=p^{3}$. It remains to show that $\Sigma_{n-1}^{p}=\Sigma_{n}$. Let $\alpha, \beta, \gamma \in p^{n-1} \mathbb{Z}_{p}$; using Lemmas 4.4 and 4.8 in tandem,

$$
\left(x^{\alpha} y_{1}^{\beta} y_{2}^{\gamma}\right)^{p}=x^{p \alpha} y_{1}^{p \beta} y_{2}^{p \gamma}\left(y_{1}^{a} y_{2}^{b}\right)^{\beta}\left(y_{1}^{c} y_{2}^{d}\right)^{\gamma}
$$

for some $a, b, c, d \in \mathbb{Z}_{p}$, which only depend on $\alpha$. From Lemma 4.9, if $\alpha \in p^{2} \mathbb{Z}_{p}$ then $a, b, c, d \in p^{2} \mathbb{Z}_{p}$; furthermore, $\Sigma_{n-1}^{p} \subset \Sigma_{n}$ for every $n \geq 3$ upon applying Lemma 4.11.

Let $g=x^{\alpha} y_{1}^{\beta} y_{2}^{\gamma} \in \Sigma_{n}$ with $\alpha, \beta, \gamma \in p^{n} \mathbb{Z}_{p}$, and set $\alpha_{0}=\alpha / p \in p^{n-1} \mathbb{Z}_{p}$. We may then associate to $\alpha_{0}$ these constants $a, b, c, d$ as described above. Consider the simultaneous equations

$$
\begin{aligned}
\beta_{0}+\frac{a}{p} \beta_{0}+\frac{c}{p} \gamma_{0} & =\frac{\beta}{p} \\
\gamma_{0}+\frac{b}{p} \beta_{0}+\frac{d}{p} \gamma_{0} & =\frac{\gamma}{p}
\end{aligned}
$$

Since $n \geq 3$, we have $a, b, c, d \in p^{2} \mathbb{Z}_{p}$. Therefore, all coefficients above are in $\mathbb{Z}_{p}$ and the determinant of the equations is congruent to 1 modulo $p$. Therefore, we may solve $\beta_{0}, \gamma_{0} \in p^{n-1} \mathbb{Z}_{p}$. In other words, if $g_{0}=x^{\alpha_{0}} y_{1}^{\beta_{0}} y_{2}^{\gamma_{0}}$, then $g_{0} \in \Sigma_{n-1}$ and $g_{0}^{p}=g$; hence $\Sigma_{n} \subset \Sigma_{n-1}^{p}$ as required.

Finally, the proof for the statement $k_{\infty} \cap K_{n}=k_{n}$ follows from the same argument as that for Lemma 3.3 on replacing Lemma 3.2 by Lemma 4.11.
Remarks: (i) Recall that a pro-p group $G$ is powerful if $G / \overline{G^{p}}$ is abelian. In particular, as $G$ is finitely generated, $G^{p}$ coincides with its Frattini subgroup. Note further that $G_{\infty}$ always contains an open subgroup which is powerful (see [5, Corollary 4.3]), therefore after a finite base-change of $k$, one may assume that $G_{\infty}$ is a powerful.
(ii) If we take $\Sigma_{n}=P_{n}\left(G_{\infty}\right)$ to be the lower $p$-series of $G_{\infty}$, i.e.

$$
P_{1}\left(G_{\infty}\right)=G_{\infty} \quad \text { and } \quad P_{i+1}\left(G_{\infty}\right)=\overline{P_{i}\left(G_{\infty}\right)^{p}\left[P_{i}\left(G_{\infty}\right), G_{\infty}\right]} \quad \text { for } i \geq 1
$$

then $\Sigma_{n-1}^{p}=\Sigma_{n}\left(\right.$ from [5, Theorem 3.6]) and $\left[\Sigma_{n-1}: \Sigma_{n}\right]=p^{3}$ if $n \gg 1$, since $\Sigma_{n}$ is uniform whenever $n \gg 1$ (see [5, Theorem 4.2]). In particular, this yields an alternative method to obtain the asymptotic bound on $\operatorname{rank}_{\mathbb{Z}}\left(A\left(K_{n}\right)\right)$.

## Appendix A. An improvement on Theorem 4.2

In this appendix, we show that Theorem 4.2 in fact holds for $n \geq 1$ if the constants $a_{1}, b_{1}, d_{1}$ are congruent to 0 modulo $p^{2}$. Under this additional assumption, one has the following

Lemma A.1. Let $\alpha \in \mathbb{Z}_{p}$, then

$$
\prod_{n=1}^{p-1}\left[x^{n \alpha}, y_{1}\right] \in Y^{p^{2}} \quad \text { and } \quad \prod_{n=1}^{p-1}\left[x^{n \alpha}, y_{2}\right] \in\left\langle y_{1}^{p}, y_{2}^{p^{2}}\right\rangle
$$

Proof. Upon replacing $p$ by $p^{2}$, the proof of Corollary 4.6 implies

$$
\left[x^{n}, y_{1}\right] \in Y^{p^{2}} \quad \text { and } \quad\left[x^{n}, y_{2}\right] \equiv y_{1}^{n c_{1}} \quad \bmod Y^{p^{2}} \quad \text { at each } n \in \mathbb{N}
$$

By continuity, one knows that

$$
\left[x^{\alpha}, y_{1}\right] \in Y^{p^{2}} \quad \text { and } \quad\left[x^{\alpha}, y_{2}\right] \equiv y_{1}^{\alpha c_{1}} \quad \bmod Y^{p^{2}}
$$

for all $\alpha \in \mathbb{Z}_{p}$, which gives the first part of the lemma. For the second part,

$$
\prod_{n=1}^{p-1}\left[x^{n \alpha}, y_{2}\right] \equiv \prod_{n=1}^{p-1} y_{1}^{n \alpha c_{1}} \equiv y_{1}^{p(p-1) \alpha c_{1} / 2} \quad \bmod Y^{p^{2}}
$$

as required.
Proposition A.2. For all $n \geq 1, \Sigma_{n-1}^{p}=\Sigma_{n}$.

Proof. As in $\S 4.2$, for $n \geq 1$ and $\alpha, \beta, \gamma \in p^{n-1} \mathbb{Z}_{p}$, we have

$$
\left(x^{\alpha} y_{1}^{\beta} y_{2}^{\gamma}\right)^{p}=x^{p \alpha} y_{1}^{p \beta} y_{2}^{p \gamma}\left(y_{1}^{a} y_{2}^{b}\right)^{\beta}\left(y_{1}^{c} y_{2}^{d}\right)^{\gamma}
$$

for some $a, b, c, d \in \mathbb{Z}_{p}$. But Lemma A. 1 implies that $a, b, d \equiv 0 \bmod p^{2}$ and $c \equiv 0$ $\bmod p$, therefore $\Sigma_{n-1}^{p} \subset \Sigma_{n}^{p}$.

Let $g=x^{\alpha} y_{1}^{\beta} y_{2}^{\gamma} \in \Sigma_{n}$ with $\alpha, \beta, \gamma \in p^{n} \mathbb{Z}_{p}$; as in $\S 4.2$, we need to solve

$$
\begin{aligned}
\beta_{0}+\frac{a}{p} \beta_{0}+\frac{c}{p} \gamma_{0} & =\frac{\beta}{p} \\
\gamma_{0}+\frac{b}{p} \beta_{0}+\frac{d}{p} \gamma_{0} & =\frac{\gamma}{p}
\end{aligned}
$$

where $a, b, c, d$ are constants associated to $\alpha_{0}=\alpha / p$. But $a, b, d \equiv 0 \bmod p^{2}$ and $c \equiv 0 \bmod p$ by Lemma A.1, all coefficients above are in $\mathbb{Z}_{p}$ and the determinant of the equations is congruent to 1 modulo $p$. Therefore, we may solve for $\beta_{0}$ and $\gamma_{0}$ and proceed as before.

Remark: One can give a more explicit proof for Proposition A. 2 when $G_{\infty}$ is the full Heisenberg group (namely for case (2) of Theorem 4.1, with $s=0$ ). In this situation, $G_{\infty}$ will be isomorphic to the matrix group $\left(\begin{array}{ccc}1 & \mathbb{Z}_{p} & \mathbb{Z}_{p} \\ 0 & 1 & \mathbb{Z}_{p} \\ 0 & 0 & 1\end{array}\right)$ hence $\Sigma_{n}$ may be identified with $\left(\begin{array}{ccc}1 & p^{n} \mathbb{Z}_{p} & p^{n} \mathbb{Z}_{p} \\ 0 & 1 & p^{n} \mathbb{Z}_{p} \\ 0 & 0 & 1\end{array}\right)$.
Let $g=\left(\begin{array}{ccc}1 & a & c \\ 0 & 1 & b \\ 0 & 0 & 1\end{array}\right) \in G_{\infty}$, so that

$$
g^{p}=\left(\begin{array}{ccc}
1 & p a & p c+\binom{p}{2} a b \\
0 & 1 & p b \\
0 & 0 & 1
\end{array}\right)
$$

As a corollary, $g \in \Sigma_{n-1}$ implies that $g^{p} \in \Sigma_{n}$ as $p \neq 2$.
Conversely if $g \in \Sigma_{n}$, there exist $a_{0}, b_{0} \in p^{n-1} \mathbb{Z}_{p}$ such that $p a_{0}=a$ and $p b_{0}=b$. As $p \neq 2$, we have $c-\binom{p}{2} a_{0} b_{0} \in p^{n} \mathbb{Z}_{p}$; consequently there exists $c_{0} \in p^{n-1} \mathbb{Z}_{p}$ such that $p c_{0}+\binom{p}{2} a_{0} b_{0}=c$. Then

$$
g_{0}:=\left(\begin{array}{ccc}
1 & a_{0} & c_{0} \\
0 & 1 & b_{0} \\
0 & 0 & 1
\end{array}\right) \in \Sigma_{n-1} \quad \text { and } \quad g_{0}^{p}=g
$$

and the proposition follows.

## Appendix B. Explicit calculations of representations

The proofs of both Theorems 3.4 and 4.3 rely on constructing a filtration as given by (2.2) with the property that $\Sigma_{n}=\Sigma_{n-1}^{p}$ when $n$ is large enough, which is sufficient because of Lemma 2.5. In this appendix, we show that the conclusion on traces of regular representations given in Lemma 2.5 may be obtained directly, when $G_{\infty}$ is either non-abelian of dimension 2 or a Heisenberg group; this involves
us undertaking a low-brow study of the Adams operator $\psi_{p}$ acting on the regular representation.
B.1. Representations of the false-Tate curve tower. We first study how the $\psi_{p}$-operator acts on $R_{p}\left(G_{n}\right)$, where the group

$$
G_{n}=H_{n} \rtimes \Upsilon_{n} \quad \text { such that } H_{n}=\mathbb{Z}_{p} / p^{n} \mathbb{Z}_{p} \text { and } \Upsilon_{n}=\Delta \times \frac{1+p \mathbb{Z}_{p}}{1+p^{n} \mathbb{Z}_{p}}
$$

with $\Delta \triangleleft \mu_{p-1} \subset \mathbb{Z}_{p}^{\times}$.
For each positive integer $m \leq n$, we shall write $\eta_{m}: \mathbb{Z}_{p} / p^{n} \mathbb{Z}_{p} \longrightarrow \mu_{p^{m}}$ for the multiplicative character sending $x \mapsto \exp \left(2 \pi i x / p^{m}\right)$ at every $x \in H_{n}$ (clearly one can equally well view $\eta_{m}$ as a character of $H_{k}$ if $\left.m \leq k \leq n\right)$. By [6, Lemma 15], the irreducible representations of $G_{n}$ of dimension $>1$ are of the form

$$
\operatorname{Ind}_{H_{m}}^{G_{m}}\left(\eta_{m}\right) \otimes \beta \quad \text { where } m \leq n, \text { and } \beta: \Upsilon_{n} \longrightarrow \overline{\mathbb{Q}}_{p}^{\times} \text {multiplicatively. }
$$

N.B. Any representation of $G_{m}$ for $m<n$ is automatically a representation of the larger group $G_{n}$, courtesy of the projection maps $G_{n} \rightarrow G_{m}$.
Proposition B.1. If the additive character $\chi^{(n, \beta)}=\operatorname{Tr}\left(\operatorname{Ind}_{H_{n}}^{G_{n}}\left(\eta_{n}\right) \otimes \beta\right)$, then one has an equality

$$
\psi_{p} \circ \chi^{(n, \beta)}=p \cdot \operatorname{Tr}\left(\operatorname{Ind}_{H_{n-1}}^{G_{n-1}}\left(\eta_{n-1}\right) \otimes \beta^{p}\right) \quad \text { inside the virtual ring } R_{p}\left(G_{n}\right) .
$$

Proof. We begin by making two simplifying assumptions:

- The group $G_{n}=\mathbb{Z} / p^{n} \mathbb{Z} \rtimes\left(\mathbb{Z} / p^{n} \mathbb{Z}\right)^{\times}$, i.e. $\Delta$ is the whole of $\mathbb{F}_{p}^{\times}$;
- The character $\beta$ is trivial on $\Upsilon_{n}=\left(\mathbb{Z} / p^{n} \mathbb{Z}\right)^{\times}$.

Therefore our task is to show for all $g \in G_{n}$,

$$
\operatorname{Tr}\left(\operatorname{Ind}_{H_{n}}^{G_{n}}\left(\eta_{n}\right)\left(g^{p}\right)\right)=p \times \operatorname{Tr}\left(\operatorname{Ind}_{H_{n-1}}^{G_{n-1}}\left(\eta_{n-1}\right)(g)\right)
$$

We again proceed by undertaking a low-brow computation. Observe that

$$
G_{n} \cong\left(\begin{array}{cc}
\Upsilon_{n} & H_{n} \\
0 & 1
\end{array}\right) \triangleleft \mathrm{GL}\left(2, \mathbb{Z}_{p} / p^{n} \mathbb{Z}_{p}\right)
$$

and let's write $g_{x}=\left(\begin{array}{cc}x & 0 \\ 0 & 1\end{array}\right)$ at each $x \in \Upsilon_{n}$.
Remarks: (a) If $g=\left(\begin{array}{cc}a & b \\ 0 & 1\end{array}\right) \in G_{n}$ then $g_{x} \cdot g \cdot g_{x}^{-1}=\left(\begin{array}{cc}a & x b \\ 0 & 1\end{array}\right)$, hence

$$
\operatorname{Tr}\left(\operatorname{Ind}_{H_{n}}^{G_{n}}\left(\eta_{n}\right)(g)\right)=\sum_{\substack{x \in G_{n} / H_{n} \text { with } \\
g_{x} \cdot g \cdot g_{x}^{-1} \in H_{n}}} \eta_{n}\left(\begin{array}{cc}
a & x b \\
0 & 1
\end{array}\right)
$$

(b) Certainly when $a \neq 1$ the sum is empty, thus $\operatorname{Tr}\left(\operatorname{Ind}_{H_{n}}^{G_{n}}\left(\eta_{n}\right)(g)\right)=0$.
(c) Alternatively if $a=1$, then

$$
\operatorname{Tr}\left(\operatorname{Ind}_{H_{n}}^{G_{n}}\left(\eta_{n}\right)(g)\right)=\sum_{x \in \Upsilon_{n}} \exp \left(2 \pi i x b / p^{n}\right)=\left\{\begin{array}{cl}
p^{n}-p^{n-1} & \text { if } p^{n} \mid b \\
-p^{n-1} & \text { if } p^{n-1} \| b \\
0 & \text { otherwise }
\end{array}\right.
$$

Recall that $g=\left(\begin{array}{cc}a & b \\ 0 & 1\end{array}\right)$; it is then an easy exercise to show

- If $g^{p}=1$ then $a^{p}=1$ and $p^{n-1} \mid b ;$
- If $g^{p}=\left(\begin{array}{ll}1 & b^{\prime} \\ 0 & 1\end{array}\right)$ with $p^{n-1} \mid b^{\prime}$, then $a^{p}=1$ and $p^{n-2} \mid b$.

As an immediate consequence,

$$
\operatorname{Tr}\left(\operatorname{Ind}_{H_{n}}^{G_{n}}\left(\eta_{n}\right)\left(g^{p}\right)\right)= \begin{cases}p^{n}-p^{n-1} & \text { if } a^{p}=1 \text { and } p^{n-1} \mid b \\ -p^{n-1} & \text { if } a^{p}=1 \text { and } p^{n-2} \| b \\ 0 & \text { otherwise }\end{cases}
$$

On the other hand, putting $W_{n}=\operatorname{Ker}\left(G_{n} \rightarrow G_{n-1}\right)$ one calculates

$$
\operatorname{Tr}\left(\operatorname{Ind}_{H_{n-1}}^{G_{n-1}}\left(\eta_{n-1}\right)(g)\right)= \begin{cases}p^{n-1}-p^{n-2} & \text { if } g \in W_{n} \\
-p^{n-2} & \text { if } g W_{n}=\left(\begin{array}{cc}
1 & b \\
0 & 1
\end{array}\right) \text { with } p^{n-2} \| b \\
0 & \text { otherwise }\end{cases}
$$

this is numerically equal to the previous trace divided by $p$, so we are done.
Remarks: (i) The general case where $\Delta \subset \mathbb{F}_{p}^{\times}$can be treated as follows. Using the notation $G_{n}^{(\Delta)}=H_{n} \rtimes \Upsilon_{n}^{(\Delta)}$ with $\Upsilon_{n}^{(\Delta)}=\Delta \times \frac{1+p \mathbb{Z}_{p}}{1+p^{\mathbb{Z}_{p}}}$, the square

is commutative, since $G_{n}^{(\Delta)}$ is normal inside $G_{n}^{\left(\mathbb{F}_{p}^{\times}\right)}$with quotient $\cong \mathbb{F}_{p}^{\times} / \Delta$.
(ii) However $\operatorname{Ind}_{H_{m}}^{G_{m}^{\left(\mathbb{F}_{p}^{\times}\right)}}\left(\eta_{m}\right)=\operatorname{Ind}_{\Delta}^{\mathbb{F}_{p}^{\times}}\left(\operatorname{Ind}_{H_{m}}^{G_{m}^{(\Delta)}}\left(\eta_{m}\right)\right)$ for $m=n$ and $m=n-1$, thus the assertion in $R_{p}\left(G_{n}^{(\Delta)}\right)$ can be deduced from its cousin in $R_{p}\left(G_{n}^{\left(\mathbb{F}_{p}^{\times}\right)}\right)$.
(iii) Finally, if $\beta$ is a non-trivial character on $\Upsilon_{n}$ then amongst the virtual characters, one has $\psi_{p} \circ \operatorname{Tr}(\sigma \otimes \beta)(g)=\operatorname{Tr}(\sigma \otimes \beta)\left(g^{p}\right)=\beta(g)^{p} \times \psi_{p} \circ \operatorname{Tr}(\sigma)(g)$; in particular, this allows us to incorporate $\beta$ into our previous formulae.

Corollary B.2. For all $n \geq 2$, one has $\psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{G_{n}}\right)=p^{2} \times \operatorname{Tr}\left(\operatorname{reg}_{G_{n-1}}\right)$.
Proof. We show it first for $G_{n}=\mathbb{Z}_{p} / p^{n} \mathbb{Z}_{p} \rtimes\left(\mathbb{Z}_{p} / p^{n} \mathbb{Z}_{p}\right)^{\times}$, i.e. for $\Delta=\mathbb{F}_{p}^{\times}$. The regular representation on $G_{n}$ decomposes into

$$
\operatorname{reg}_{G_{n}} \cong \operatorname{reg}_{\Upsilon_{n}} \oplus \bigoplus_{k=1}^{n} \bigoplus_{\beta \in \mathfrak{X}\left(\Upsilon_{n} / \Upsilon_{k}\right)}\left(\operatorname{Ind}_{H_{k}}^{G_{k}}\left(\eta_{k}\right) \otimes \beta\right)^{p^{k}-p^{k-1}}
$$

where $\mathfrak{X}(-)$ denotes the character group $\operatorname{Hom}_{\text {cont }}\left(-, \mathbb{G}_{m}\right)$; it follows that

$$
\operatorname{Tr}\left(\operatorname{reg}_{G_{n}}\right)=\sum_{\alpha \in \mathfrak{X}\left(\Upsilon_{n}\right)} \alpha+\sum_{k=1}^{n} \sum_{\beta \in \mathfrak{X}\left(\Upsilon_{n} / \Upsilon_{k}\right)}\left(p^{k}-p^{k-1}\right) \times \operatorname{Tr}\left(\operatorname{Ind}_{H_{k}}^{G_{k}}\left(\eta_{k}\right) \otimes \beta\right)
$$

Upon applying the previous proposition, $\psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{G_{n}}\right)$ must then equal

$$
\sum_{\alpha \in \mathfrak{X}\left(\Upsilon_{n}\right)} \alpha^{p}+\sum_{k=1}^{n} \sum_{\beta \in \mathfrak{X}\left(\Upsilon_{n} / \Upsilon_{k}\right)}\left(p^{k}-p^{k-1}\right) \times p \cdot \operatorname{Tr}\left(\operatorname{Ind}_{H_{k-1}}^{G_{k-1}}\left(\eta_{k-1}\right) \otimes \beta^{p}\right) .
$$

Clearly $\sum_{\alpha \in \mathfrak{X}\left(\Upsilon_{n}\right)} \alpha^{p}=p \cdot \sum_{\alpha \in \mathfrak{X}\left(\Upsilon_{n-1}\right)} \alpha=p \cdot \operatorname{Tr}\left(\operatorname{reg}_{\Upsilon_{n-1}}\right)$, whilst

$$
\sum_{\beta \in \mathfrak{X}\left(\Upsilon_{n} / \Upsilon_{1}\right)}(p-1) \times p \cdot \operatorname{Tr}\left(\operatorname{Ind}_{H_{0}}^{G_{0}}\left(\eta_{0}\right) \otimes \beta^{p}\right)=\left(p^{2}-p\right) \times \operatorname{Tr}\left(\operatorname{reg}_{\Upsilon_{n-1}}\right)
$$

As a direct consequence, plugging these numbers back into our formula:

$$
\begin{aligned}
& \psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{G_{n}}\right)= p^{2} \times \operatorname{Tr}\left(\operatorname{reg}_{\Upsilon_{n-1}}\right) \\
&+\sum_{k=2}^{n} \sum_{\beta \in \mathfrak{X}\left(\Upsilon_{n} / \Upsilon_{k}\right)}\left(p^{k+1}-p^{k}\right) \times \operatorname{Tr}\left(\operatorname{Ind}_{H_{k-1}}^{G_{k-1}}\left(\eta_{k-1}\right) \otimes \beta^{p}\right) \\
&=p^{2}\left(\operatorname{Tr}\left(\operatorname{reg}_{\Upsilon_{n-1}}\right)+\sum_{k=1}^{n-1} \sum_{\beta \in \mathfrak{X}\left(\Upsilon_{n} / \Upsilon_{k+1}\right)}\left(p^{k}-p^{k-1}\right) \times \operatorname{Tr}\left(\operatorname{Ind}_{H_{k}}^{G_{k}}\left(\eta_{k}\right) \otimes \beta^{p}\right)\right) .
\end{aligned}
$$

However $\sum_{\beta \in \mathfrak{X}\left(\Upsilon_{n} / \Upsilon_{k+1}\right)} \operatorname{Tr}\left(\sigma \otimes \beta^{p}\right)=\sum_{\beta \in \mathfrak{X}\left(\Upsilon_{n-1} / \Upsilon_{k}\right)} \operatorname{Tr}(\sigma \otimes \beta)$, thence

$$
\psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{G_{n}}\right)=p^{2}\left(\operatorname{Tr}\left(\operatorname{reg}_{\Upsilon_{n-1}}\right)+\ldots\right)=p^{2} \times \operatorname{Tr}\left(\operatorname{reg}_{G_{n-1}}\right)
$$

Remark: When $\Delta$ is a proper subgroup of $\mathbb{F}_{p}^{\times}$, we use the commutativity of

together with the fact $\operatorname{reg}_{G_{n}^{(\Delta)}}$ occurs as a direct summand in reg ${ }_{\left.G_{n}^{(\mathbb{P} \times}\right)}$.
B.2. Representations of the Heisenberg group. Consider the group $\mathcal{H}_{n}=$ $\mathrm{GL}\left(3, \mathbb{Z} / p^{n} \mathbb{Z}\right) \cap\left(\begin{array}{ccc}1 & \star & \star \\ 0 & 1 & \star \\ 0 & 0 & 1\end{array}\right)$ of order $\# \mathcal{H}_{n}=p^{3 n}$. For each integer $m$ in the range $0 \leq m \leq n$, one defines subgroups

$$
\mathcal{U}_{n}^{(m)}:=\left(\begin{array}{ccc}
1 & \star & \star \\
0 & 1 & p^{m} \mathbb{Z} / p^{n} \\
0 & 0 & 1
\end{array}\right), \quad \mathcal{V}_{n}^{(m)}:=\left[\mathcal{U}_{n}^{(m)}, \mathcal{U}_{n}^{(m)}\right]=\left(\begin{array}{ccc}
1 & 0 & p^{m} \mathbb{Z} / p^{n} \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right)
$$

In particular, if we fix a character $\chi: \mathcal{U}_{n}^{(m)} \rightarrow \mathbb{C}^{\times}$then $\rho_{n}^{(m, \chi)}:=\operatorname{Ind}_{\mathcal{U}_{n}^{(m)}}^{\mathcal{H}_{n}}(\chi)$ furnishes us with an $\mathcal{H}_{n}$-representation, of degree equal to $\left[\mathcal{H}_{n}: \mathcal{U}_{n}^{(m)}\right]=p^{m}$. Furthermore, assuming that $\chi:\left(\begin{array}{ccc}1 & 0 & 1 \\ 0 & 1 & 0 \\ 0 & 0 & 1\end{array}\right) \mapsto \zeta$ where $\zeta \in \mu_{p^{m}}-\mu_{p^{m-1}}$ is a primitive $p^{m}$-th root of unity, it follows from an application of Mackey's irreducibility criterion for characters that $\rho_{n}^{(m, \chi)}$ is irreducible.

Proposition B.3. If $0 \leq m \leq n$ and $\chi: \mathcal{U}_{n}^{(m)} \longrightarrow \mathbb{C}^{\times}$is as above, then $\psi_{p} \circ \operatorname{Tr}\left(\operatorname{Ind}_{\mathcal{U}_{n}^{(m)}}^{\mathcal{H}_{n}}(\chi)\right)=p \cdot \operatorname{Tr}\left(\operatorname{Ind}_{\mathcal{U}_{n-1}^{(m-1)}}^{\mathcal{H}_{n-1}^{(m)}}\left(\chi^{p}\right)\right)$ inside the virtual ring $R_{p}\left(\mathcal{H}_{n}\right)$.

Proof. If $g=\left(\begin{array}{lll}1 & a & c \\ 0 & 1 & b \\ 0 & 0 & 1\end{array}\right)$ with $a, b, c \in \mathbb{Z} / p^{n} \mathbb{Z}$, we just write $g=(a, b, c)$. The conjugacy classes of $\mathcal{H}_{n}$ are given by $\left(a, b, \mathbb{Z} / p^{n} \mathbb{Z}\right)$ with $a \neq 0$ or $b \neq 0$, and also by $(0,0, c)$ for $c \in \mathbb{Z} / p^{n} \mathbb{Z}$. The individual elements $x_{i}=(0, i, 0)$ with $i \in$ $\left\{0,1, \ldots, p^{m}-1\right\}$ form a set of coset representatives for $\mathcal{H}_{n} / \mathcal{U}_{n}^{(m)}$.
Sub-Case (i): The element $x \in\left(a, b, \mathbb{Z} / p^{n} \mathbb{Z}\right)$ is such that $b \notin p^{m} \mathbb{Z} / p^{n} \mathbb{Z}$; here $x_{i} x x_{i}^{-1} \notin \mathcal{U}_{n}^{(m)}$ for all $i$, so $\operatorname{Tr}\left(\rho_{n}^{(m, \chi)}(x)\right)=0$.
Sub-Case (ii): The element $x \in\left(a, b, \mathbb{Z} / p^{n} \mathbb{Z}\right)$ is such that $b \in p^{m} \mathbb{Z} / p^{n} \mathbb{Z}$ but $a \notin p^{m} \mathbb{Z} / p^{n} \mathbb{Z}$; if we write $x=(a, b, c)$ then $x_{i} x x_{i}^{-1}=(a, b, c)(0,0,-a i)$, in which case

$$
\operatorname{Tr}\left(\rho_{n}^{(m, \chi)}(x)\right)=\chi(a, b, c) \times \sum_{i=0}^{p^{m}-1} \chi(0,0, i)^{a}=0
$$

Sub-Case (iii): The element $x \in\left(a, b, \mathbb{Z} / p^{n} \mathbb{Z}\right)$ with $a, b \in p^{m} \mathbb{Z} / p^{n} \mathbb{Z}$; if we again write $x=(a, b, c)$, as before $x_{i} x x_{i}^{-1}=(a, b, c)(0,0,-a i)$ thence

$$
\operatorname{Tr}\left(\rho_{n}^{(m, \chi)}(x)\right)=\chi(a, b, c) \times \sum_{i=0}^{p^{m}-1} \chi(0,0, i)^{a}=p^{m} \times \chi(a, b, c)
$$

Sub-Case (iv): The element $x \in Z\left(\mathcal{H}_{n}\right)=\left(0,0, \mathbb{Z} / p^{n} \mathbb{Z}\right)$, so $x_{i} x x_{i}^{-1}=x$ and consequently $\operatorname{Tr}\left(\rho_{n}^{(m, \chi)}(x)\right)=p^{m} \times \chi(x)$.

In summary, we have thus far established

$$
\operatorname{Tr}\left(\rho_{n}^{(m, \chi)}(a, b, c)\right)= \begin{cases}0 & \text { if either } a \text { or } b \notin p^{m} \mathbb{Z} / p^{n} \mathbb{Z} \\ p^{m} \chi(a, b, c) & \text { otherwise }\end{cases}
$$

However $\chi^{p}$ will determine a one-dimensional character on $\mathcal{U}_{n-1}^{(m-1)} / \mathcal{V}_{n-1}^{(m-1)}$, and certainly $\chi^{p}(0,0,1) \in \mu_{p^{m-1}}-\mu_{p^{m-2}}$. By the previous discussion

$$
\psi_{p} \circ \operatorname{Tr}\left(\rho_{n}^{(m, \chi)}(a, b, c)\right)= \begin{cases}0 & \text { if either } a \text { or } b \notin p^{m-1} \mathbb{Z} / p^{n} \mathbb{Z} \\ p^{m} \chi^{p}(a, b, c) & \text { otherwise }\end{cases}
$$

and the result now follows.
Corollary B.4. For all $n \geq 2$, one has $\psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{\mathcal{H}_{n}}\right)=p^{3} \times \operatorname{Tr}\left(\operatorname{reg}_{\mathcal{H}_{n-1}}\right)$.

Proof. Let $\overline{\mathcal{U}}_{n, \text { conj }}^{(m)}$ be a set of representative characters $\chi$ on the group $\mathcal{U}_{n}^{(m)}$, which yield irreducible (pairwise) non-isomorphic $\rho_{n}^{(m, \chi)}$, s. We have $\# \overline{\mathcal{U}}_{n, \text { conj }}^{(m)}=$ $\phi\left(p^{n-m}\right) \times p^{n}$. Moreover, the map sending $\chi \mapsto \chi^{p}$, induces a degree $p$ covering $\overline{\mathcal{U}}_{n, \text { conj }}^{(m)} \rightarrow \overline{\mathcal{U}}_{n-1, \text { conj }}^{(m-1)}$ on these representative characters sets.

Since $\operatorname{reg}_{\mathcal{H}_{n}} \cong \operatorname{reg}_{\mathcal{H}_{n}^{\text {ab }}} \oplus \bigoplus_{m=1}^{n} \bigoplus_{\chi \in \overline{\mathcal{U}}_{n, \text { conj }}^{(m)}}\left(\operatorname{Ind}_{\mathcal{U}_{n}^{(m)}}^{\mathcal{H}_{n}}(\chi)\right)^{p^{m}}$, its trace equals

$$
\begin{equation*}
\operatorname{Tr}\left(\operatorname{reg}_{\mathcal{H}_{n}}\right)=\sum_{\psi \in \widehat{\mathcal{H}_{n}^{\mathrm{ab}}}} \psi+\sum_{m=1}^{n} \sum_{\chi \in \overline{\mathcal{U}_{n, \text { conj }}^{(m)}}} p^{m} \times \operatorname{Tr}\left(\operatorname{Ind}_{\mathcal{U}_{n}^{(m)}}^{\mathcal{H}_{n}}(\chi)\right) . \tag{B.1}
\end{equation*}
$$

Hitting this with the $p$-th Adams operator, and applying Proposition B.3,

$$
\begin{aligned}
\psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{\mathcal{H}_{n}}\right)= & \sum_{\psi \in \widehat{\mathcal{H}_{n}^{\mathrm{ab}}}} \psi^{p}+\sum_{m=1}^{n} \sum_{\chi \in \overline{\mathcal{U}}_{n, \text { conj }}^{(m)}} p^{m} \times p \cdot \operatorname{Tr}\left(\operatorname{Ind}_{\mathcal{U}_{n-1}^{(m-1)}}^{\mathcal{H}_{n-1}}\left(\chi^{p}\right)\right) \\
= & \frac{\# \mathcal{H}_{n}^{\mathrm{ab}}}{\# \mathcal{H}_{n-1}^{a b}} \times \sum_{\psi^{\prime} \in \overline{\mathcal{H}_{n-1}^{\mathrm{ab}}}} \psi^{\prime}+p^{2} \times \frac{\# \overline{\mathcal{U}}_{n, \text { conj }}^{(1)}}{\# \mathcal{H}_{n-1}^{\mathrm{ab}}} \times \operatorname{Tr}\left(\operatorname{reg}_{\mathcal{H}_{n-1}^{\mathrm{ab}}}\right) \\
& +\sum_{m^{\prime}=1}^{n-1} \sum_{\chi \in \overline{\mathcal{U}}_{n, \text { oonj }}^{\left(m^{\prime}+1\right)}} p^{m^{\prime}+2} \times \operatorname{Tr}\left(\operatorname{Ind}_{\mathcal{U}_{n-1}^{\left(\mathcal{H}^{\prime}\right)}}^{\mathcal{H}_{n-1}}\left(\chi^{p}\right)\right) .
\end{aligned}
$$

The following identities are straightforward to derive:

- $\# \mathcal{H}_{n}^{\mathrm{ab}}=\left[\mathcal{U}_{n}^{(0)}: \mathcal{V}_{n}^{(0)}\right]=p^{2 n}=p^{2} \times\left[\mathcal{U}_{n-1}^{(0)}: \mathcal{V}_{n-1}^{(0)}\right]=p^{2} \times \# \mathcal{H}_{n-1}^{\mathrm{ab}} ;$
- $\# \overline{\mathcal{U}}_{n, \mathrm{conj}}^{(1)}=\phi\left(p^{n-1}\right) \times p^{n}=(p-1) \times \# \mathcal{H}_{n-1}^{\mathrm{ab}}$;
- $\# \overline{\mathcal{U}}_{n, \text { conj }}^{\left(m^{\prime}+1\right)}=\phi\left(p^{n-m^{\prime}-1}\right) \times p^{n}=p \times \# \overline{\mathcal{U}}_{n-1, \mathrm{conj}}^{\left(m^{\prime}\right)}$.

Substituting these back into our previous expression, one concludes that

$$
\begin{aligned}
& \psi_{p} \circ \operatorname{Tr}\left(\operatorname{reg}_{\mathcal{H}_{n}}\right) \\
= & p^{2} \times \sum_{\psi^{\prime} \in \widehat{\mathcal{H}_{n-1}^{\mathrm{ab}}}} \psi^{\prime}+p^{2} \times(p-1) \times \operatorname{Tr}\left(\operatorname{reg}_{\mathcal{H}_{n-1}^{\mathrm{ab}}}\right) \\
& +\sum_{m^{\prime}=1}^{n-1} \sum_{\chi^{\prime} \in \overline{\mathcal{U}}_{n-1, \text { conj }}^{\left(m^{\prime}\right)}} p^{m^{\prime}+2} \times \frac{\# \overline{\mathcal{U}}_{n, \text { conj}}^{\left(m^{\prime}+1\right)}}{\# \overline{\mathcal{U}}_{n-1, \text { conj }}^{\left(m^{\prime}\right)}} \times \operatorname{Tr}\left(\operatorname{Ind}_{\mathcal{U}_{n-1}^{\left(m^{\prime}\right)}}^{\mathcal{H}_{n-1}}\left(\chi^{\prime}\right)\right) \\
= & p^{2} \times(1+(p-1)) \sum_{\psi^{\prime} \in \widehat{\mathcal{H}_{n-1}^{\mathrm{ab}}}} \psi^{\prime}+\sum_{m^{\prime}=1}^{n-1} \sum_{\chi^{\prime} \in \overline{\mathcal{U}}_{n-1, \text { conj }}^{\left(m^{\prime}\right)}} p^{m^{\prime}+3} \times \operatorname{Tr}\left(\operatorname{Ind}_{\mathcal{U}_{n-1}^{\left(m^{\prime}\right)}}^{\mathcal{H}_{n-1}}\left(\chi^{\prime}\right)\right),
\end{aligned}
$$

which coincides with $p^{3} \times \operatorname{Tr}\left(\operatorname{reg}_{\mathcal{H}_{n-1}}\right)$ by (B.1).
